

The sTeX3 Package *

Michael Kohlhase, Dennis Müller
FAU Erlangen-Nürnberg
<http://kwarc.info/>

2022-03-31

Abstract

sTeX is a collection of L^AT_EX package that allow to markup documents semantically without leaving the document format, essentially turning L^AT_EX into a document format for mathematical knowledge management (MKM). sTeX augments L^AT_EX with

- *Semantic macros* that denote and distinguish between mathematical concepts, operators, etc. independent of their notational presentation,
- A powerful *module system* that allows for authoring and importing individual fragments containing document text and/or semantic macros, independent of – and without hard coding – directory paths relative to the current document,
- A mechanism for exporting sTeX documents to (modular) XHTML, preserving all the semantic information for semantically informed knowledge management services.

This is the full documentation of sTeX. It consists of four parts:

- **Part I** is a general manual for the sTeX package and associated software. It is primarily directed at end-users who want to use sTeX to author semantically enriched documents.
- **Part II** documents the macros provided by the sTeX package. It is primarily directed at package authors who want to build on sTeX, but can also serve as a reference manual for end-users.
- **Part III** documents additional packages that build on sTeX, primarily its module system. These are not part of the sTeX package itself, but useful additions enabled by sTeX package functionality.
- **Part IV** is the detailed documentation of the sTeX package implementation.

*Version 3.0 (last revised 2022-03-31)

Contents

Part I

Manual

Boxes like this one contain implementation details that are mostly relevant for more advanced use cases, might be useful to know when debugging, or might be good to know to better understand how something works. They can easiyl be skipped on a first read.

Boxes like this one explain how some $\text{\texttt{sTeX}}$ concept relates to the MMT/OMDoc system, philosophy or language.

Chapter 1

What is sTeX?

Formal systems for mathematics (such as interactive theorem provers) have the potential to significantly increase both the accessibility of published knowledge, as well as the confidence in its veracity, by rendering the precise semantics of statements machine actionable. This allows for a plurality of added-value services, from semantic search up to verification and automated theorem proving. Unfortunately, their usefulness is hidden behind severe barriers to accessibility; primarily related to their surface languages reminiscent of programming languages and very unlike informal standards of presentation.

sTeX minimizes this gap between informal and formal mathematics by integrating formal methods into established and widespread authoring workflows, primarily L^AT_EX, via non-intrusive semantic annotations of arbitrary informal document fragments. That way formal knowledge management services become available for informal documents, accessible via an IDE for authors and via generated *active* documents for readers, while remaining fully compatible with existing authoring workflows and publishing systems.

Additionally, an extensible library of reusable document fragments is being developed, that serve as reference targets for global disambiguation, intermediaries for content exchange between systems and other services.

Every component of the system is designed modularly and extensibly, and thus lay the groundwork for a potential full integration of interactive theorem proving systems into established informal document authoring workflows.

The general sTeX workflow combines functionalities provided by several pieces of software:

- The sTeX package to use semantic annotations in L^AT_EX documents,
- RuSTeX to convert `tex` sources to (semantically enriched) `xhtml`,
- The MMT software, that extracts semantic information from the thus generated `xhtml` and provides semantically informed added value services.

Chapter 2

Quickstart

2.1 Setup

2.1.1 The sTeX IDE

TODO: VSCode Plugin

2.1.2 Manual Setup

Foregoing on the sTeX IDE, we will need several pieces of software; namely:

- **The sTeX-Package** available [here](#).
sTeX is also available on CTAN and in TeXLive.
- To make sure that sTeX too knows where to find its archives, we need to set a global system variable `MATHHUB`, that points to your local `MathHub`-directory (see [section 3.2](#)).

- **The Mmt System** available [here](#)¹. We recommend following the setup routine documented [here](#).

Following the setup routine (Step 3) will entail designating a `MathHub`-directory on your local file system, where the MMT system will look for sTeX/MMT content archives.

- **sTeX Archives** If we only care about L^ATeX and generating pdfs, we do not technically need MMT at all; however, we still need the `MATHHUB` system variable to be set. Furthermore, MMT can make downloading content archives we might want to use significantly easier, since it makes sure that all dependencies of (often highly interrelated) sTeX archives are cloned as well.

Once set up, we can run `mmt` in a shell and download an archive along with all of its dependencies like this: `lmh install <name-of-repository>`, or a whole *group* of archives; for example, `lmh install smglom` will download all `smglom` archives.

- **RuSTeX** The MMT system will also set up RuSTeX for you, which is used to generate (semantically annotated) `xhtml` from tex sources. In lieu of using MMT, you can also download and use RuSTeX directly [here](#).

¹EdNOTE: For now, we require the sTeX-branch, requiring manually compiling the MMT sources

2.2 A First \LaTeX Document

Having set everything up, we can write a first \LaTeX document. As an example, we will use the `smglom/calculus` and `smglom/arithmetics` archives, which should be present in the designated MathHub-folder, and write a small fragment defining the *geometric series*:

TODO: use some sTeX -archive instead of `smglom`, use a convergence-notion that includes the limit, mark-up the theorem properly

```

1 \documentclass{article}
2 \usepackage{stex,xcolor,stexthm}
3
4 \begin{document}
5 \begin{smodule}{GeometricSeries}
6   \importmodule[smglom/calculus]{series}
7   \importmodule[smglom/arithmetics]{realarith}
8
9   \symdef{geometricSeries}[name=geometric-series]{\comp{S}}
10
11   \begin{sdefinition}[for=geometricSeries]
12     The \definame{geometricSeries} is the \symname{?series}
13     \[\defeq{\geometricSeries}{\definiens{
14       \infinitesum{\svar{n}}{1}{
15         \realdivide[frac]{1}{
16           \realpower{2}{\svar{n}}
17         }
18       }}
19     \].\]
20   \end{sdefinition}
21
22   \begin{sassertion}[name=geometricSeriesConverges,type=theorem]
23     The \symname{geometricSeries} \symname{converges} towards $1$.
24   \end{sassertion}
25 \end{smodule}
26 \end{document}

```

Compiling this document with `pdflatex` should yield the output

Definition 0.1. The **geometric series** is the **series**

$$S := \sum_{n=1}^{\infty} \frac{1}{2^n}.$$

Theorem 0.2. The **geometric series converges** towards 1.

Feel free to move your cursor over the various highlighted parts of the document – depending on your pdf viewer, this should yield some interesting (but possibly for now cryptic) information.

Remark 2.2.1:

Note that all of the highlighting, tooltips, coloring and the environment headers come from `stexthm` – by default, the amount of additional packages loaded is kept to a minimum and all the presentations can be customized, see [chapter 6](#).

Let's investigate this document in detail now:

```
\begin{smodule}{GeometricSeries}
...
\end{smodule}
```

smodule First, we open a new *module* called `GeometricSeries`. This module is assigned a *globally unique* identifier (URI), which (depending on your pdf viewer) should pop up in a tooltip if you hover over the word **geometric series**.

```
\importmodule[smglom/calculus]{series}
\importmodule[smglom/arithmetics]{realarith}
```

\importmodule Next, we *import* two modules – `series` in the `smglom/calculus`-archive, and `realarith` in the `smglom/arithmetics`-archive. If we investigate these archives, we find the files `series.en.tex` and `realarith.en.tex` (respectively) in their respective **source**-folders, which contain the statements `\begin{smodule}{series}` and `\begin{smodule}{realarith}` (respectively).

The `\importmodule`-statements make all \LaTeX symbols and associated semantic macros (e.g. `\infinitesum`, `\realdive`, `\realpower`) in the desired module available. Additionally, they “export” these symbols to all further modules which include the *current* module – i.e. if in some future module we would put `\importmodule{GeometricSeries}`, we would also have `\infinitesum` etc. at our disposal.

\usemodule If we only want to *use* the content of some module `Foo`, e.g. in remarks or examples, but none of the symbols in our current module actually *depend* on the content of `Foo`, we can use `\usemodule` instead – like `\importmodule`, this will make the module content available, but will *not* export it to other modules.

```
\symdef{GeometricSeries}[name=geometric-series]{\comp{S}}
```

\symdef Next, we introduce a new *symbol* with name `geometric-series` and assign it the semantic macro `\geometricSeries`. `\symdef` also immediately assigns this symbol a *notation*, namely `S`.

\comp The macro `\comp` marks the `S` in the notation as a *notational component*, as opposed to e.g. arguments to `\geometricSeries`. It is the notational components that get highlighted and associated with the corresponding symbol (i.e. in this case `geometricSeries`). Since `\geometricSeries` takes no arguments, we can wrap the whole notation in a `\comp`.

```
\begin{sdefinition}[for=geometricSeries]
...
\end{sdefinition}
\begin{sassertion}[name=geometricSeriesConverges,type=theorem]
...
\end{sassertion}
```

What follows are two \LaTeX -statements (e.g. definitions, theorems, examples, proofs, ...). These are semantically marked-up variants of the usual environments, which take additional optional arguments (e.g. `for=`, `type=`, `name=`). Since many \LaTeX templates predefine environments like `definition` or `theorem` with different syntax, we use `sdefinition`, `sassertion`, `sexample` etc. instead. You can customize these environments to e.g. simply wrap around some predefined `theorem`-environment. That way, we can still use `sassertion` to provide semantic information, while being fully compatible with (and using the document presentation of) predefined environments.

In our case, the `stexthm`-package patches e.g. `\begin{sassertion}[type=theorem]` to use a `theorem`-environment defined (as usual) using `amsthm`.

The `\define{geometricSeries}` is the `\symname{?series}`

<u><code>\symname</code></u>	The <code>\symname</code> -command prints the name of a symbol, highlights it (based on customizable settings) and associates the text printed with the corresponding symbol. If you hover over the word <code>series</code> in the pdf output, you should see a tooltip showing the full URI of the symbol used.
<u><code>\symref</code></u>	The <code>\symname</code> -command is a special case of the more general <code>\symref</code> -command, which allows customizing the precise text associated with a symbol.
<u><code>\define</code></u> <u><code>\definiendum</code></u>	<p>The <code>sdefinition</code>-environment provides two additional macros, <code>\define</code> and <code>\definiendum</code> which behave similar to <code>\symname</code> and <code>\symref</code>, but explicitly mark the symbols as <i>being defined</i> in this environment, to allow for special highlighting.</p> <pre> \[\defeq{\geometricSeries}{\definiens{ \infinitesum{svar{n}}{1}{ \realdivide[frac]{1}{ \realpower{2}{svar{n}} } }} }].\]</pre> <p>The next snippet – set in a math environment – uses several semantic macros imported from (or recursively via) <code>series</code> and <code>realarithmetics</code>, such as <code>\defeq</code>, <code>\infinitesum</code>, etc. In math mode, using a semantic macro inserts its (default) definition. A semantic macro can have several notations – in that case, we can explicitly choose a specific notation by providing its identifier as an optional argument; e.g. <code>\realdivide[frac]{a}{b}</code> will use the explicit notation named <code>frac</code> of the semantic macro <code>\realdivide</code>, which yields $\frac{a}{b}$ instead of a/b.</p>
<u><code>\svar</code></u>	The <code>\svar{n}</code> command marks up the <code>n</code> as a variable with name <code>n</code> and notation <code>n</code> .
<u><code>\definiens</code></u>	The <code>sdefinition</code> -environment additionally provides the <code>\definiens</code> -command, which allows for explicitly marking up its argument as the <i>definiens</i> of the symbol currently being defined.

2.2.1 OMDoc/xhtml Conversion

So, if we run `pdflatex` on our document, then \LaTeX yields pretty colors and tooltips¹. But \LaTeX becomes a lot more powerful if we additionally convert our document to `xhtml`.

TODO VSCode Plugin

Using `RuSTeX`, we can convert the document to `xhtml` using the command `rustex -i /path/to/file.tex -o /path/to/outfile.xhtml`. Investigating the resulting file, we notice additional semantic information resulting from our usage of semantic macros, `\symref` etc. Below is the (abbreviated) snippet inside our `\definiens` block:

```
<mrow resource="" property="stex:definiens">
  <mrow resource="...?series?infinitesum" property="stex:OMBIND">
    <munderover displaystyle="true">
      <mo resource="...?series?infinitesum" property="stex:comp"> $\Sigma$ </mo>
      <mrow>
        <mrow resource="1" property="stex:arg">
          <mi resource="var://n" property="stex:OMV">n</mi>
        </mrow>
        <mo resource="...?series?infinitesum" property="stex:comp">=</mo>
        <mi resource="2" property="stex:arg">1</mi>
      </mrow>
      <mi resource="...?series?infinitesum" property="stex:comp"> $\infty$ </mi>
    </munderover>
    <mrow resource="3" property="stex:arg">
      <mfrac resource="...?realarith?division#frac#" property="stex:OMA">
        <mi resource="1" property="stex:arg">1</mi>
        <mrow resource="2" property="stex:arg">
          <msup resource="...realarith?exponentiation" property="stex:OMA">
            <mi resource="1" property="stex:arg">2</mi>
            <mrow resource="2" property="stex:arg">
              <mi resource="var://n" property="stex:OMV">n</mi>
            </mrow>
          </msup>
        </mrow>
      </mfrac>
    </mrow>
  </mrow>
</mrow>
```

...containing all the semantic information. The MMT system can extract from this the following OPENMATH snippet:

```
<OMBIND>
  <OMID name="...?series?infinitesum"/>
  <OMV name="n"/>
  <OMLIT name="1"/>
  <OMA>
    <OMS name="...?realarith?division"/>
    <OMLIT name="1"/>
    <OMA>
      <OMS name="...realarith?exponentiation"/>
      <OMLIT name="2"/>
      <OMV name="n"/>
    </OMA>
  </OMA>
</OMBIND>
```

¹...and hyperlinks for symbols, and indices, and allows reusing document fragments modularly, and...

...giving us the full semantics of the snippet, allowing for a plurality of knowledge management services – in particular when serving the `xhtml`.

Remark 2.2.2:

Note that the `html` when opened in a browser will look slightly different than the `pdf` when it comes to highlighting semantic content – that is because naturally `html` allows for much more powerful features than `pdf` does. Consequently, the `html` is intended to be served by a system like MMT, which can pick up on the semantic information and offer much more powerful highlighting, linking and similar features, and being customizable by *readers* rather than being prescribed by an author.

Additionally, not all browsers (most notably Chrome) support MATHML natively, and might require additional external JavaScript libraries such as MathJax to render mathematical formulas properly.

Chapter 3

Creating sTeX Content

We can use sTeX by simply including the package with `\usepackage{stex}`, or – primarily for individual fragments to be included in other documents – by using the sTeX document class with `\documentclass{stex}` which combines the `standalone` document class with the `stex` package.

Both the `stex` package and document class offer the following options:

lang ($\langle\textit{language}\rangle*$) Languages to load with the `babel` package.

mathhub ($\langle\textit{directory}\rangle$) MathHub folder to search for repositories – this is not necessary if the `MATHHUB` system variable is set.

sms ($\langle\textit{boolean}\rangle$) use *persisted* mode (not yet implemented).

image ($\langle\textit{boolean}\rangle$) passed on to `tikzinput`.

debug ($\langle\textit{log-prefix}\rangle*$) Logs debugging information with the given prefixes to the terminal, or all if `all` is given. Largely irrelevant for the majority of users.

3.1 How Knowledge is Organized in sTeX

sTeX content is organized on multiple levels:

- sTeX **archives** (see [section 3.2](#)) contain individual `.tex`-files.
- These may contain sTeX **modules**, introduced via `\begin{smodule}{ModuleName}`.
- Modules contain sTeX **symbol declarations**, introduced via `\symdecl{symbolname}`, `\symdef{symbolname}` and some other constructions. Most symbols have a *notation* that can be used via a *semantic macro* `\symbolname` generated by symbol declarations.
- sTeX **expressions** finally are built up from usages of semantic macros.

$\hookrightarrow M \rightarrow$

$\hookrightarrow M \rightarrow$

$\hookrightarrow T \rightarrow$

- sTeX archives are simultaneously MMT archives, and the same directory structure is consequently used.

- sTeX modules correspond to OMDoc/MMT *theories*. `\importmodules` (and

similar constructions) induce MMT `includes` and other *theory morphisms*, thus giving rise to a *theory graph* in the OMDOC sense.

- Symbol declarations induce OMDOC/MMT *constants*, with optional (formal) *type* and *definiens* components.
- Finally, $\text{\texttt{\textit{STEX}}}$ expressions are converted to OMDOC/MMT terms, which use the syntax of OPENMATH.

3.2 $\text{\texttt{\textit{STEX}}}$ Archives

3.2.1 The Local MathHub-Directory

`\usemodule`, `\importmodule`, `\inputref` etc. allow for including content modularly without having to specify absolute paths, which would differ between users and machines. Instead, $\text{\texttt{\textit{STEX}}}$ uses *archives* that determine the global namespaces for symbols and statements and make it possible for $\text{\texttt{\textit{STEX}}}$ to find content referenced via such URIs.

All $\text{\texttt{\textit{STEX}}}$ archives need to exist in the local MathHub-directory. $\text{\texttt{\textit{STEX}}}$ knows where this folder is via one of three means:

1. If the $\text{\texttt{\textit{STEX}}}$ package is loaded with the option `mathhub=/path/to/mathhub`, then $\text{\texttt{\textit{STEX}}}$ will consider `/path/to/mathhub` as the local MathHub-directory.
2. If the `mathhub` package option is *not* set, but the macro `\mathhub` exists when the $\text{\texttt{\textit{STEX}}}$ -package is loaded, then this macro is assumed to point to the local MathHub-directory; i.e. `\def\mathhub{/path/to/mathhub}\usepackage{stex}` will set the MathHub-directory as `path/to/mathhub`.
3. Otherwise, $\text{\texttt{\textit{STEX}}}$ will attempt to retrieve the system variable `MATHHUB`, assuming it will point to the local MathHub-directory. Since this variant needs setting up only *once* and is machine-specific (rather than defined in tex code), it is compatible with collaborating and sharing tex content, and hence recommended.

3.2.2 The Structure of $\text{\texttt{\textit{STEX}}}$ Archives

An $\text{\texttt{\textit{STEX}}}$ archive `group/name` needs to be stored in the directory `/path/to/mathhub/group/name`; e.g. assuming your local MathHub-directory is set as `/user/foo/MathHub`, then in order for the `smglom/calculus`-archive to be found by the $\text{\texttt{\textit{STEX}}}$ system, it needs to be in `/user/foo/MathHub/smglom/calculus`.

Each such archive needs two subdirectories:

- `/source` – this is where all your tex files go.
- `/META-INF` – a directory containing a single file `MANIFEST.MF`, the content of which we will consider shortly

An additional `lib`-directory is optional, and is where $\text{\texttt{\textit{STEX}}}$ will look for files included via `\libinput`.

Additionally a *group* of archives `group/name` may have an additional archive `group/meta-inf`. If this `meta-inf`-archive has a `/lib`-subdirectory, it too will be searched by `\libinput` from all tex files in any archive in the `group/*`-group.

We recommend this additional directory structure in the `source`-folder of an \TeX archive:

- `/source/mod/` – individual \TeX modules, containing symbol declarations, notations, and `\begin{paragraph}``[type=symdoc,for=...]` environments for “encyclopedic” symbol documentations
- `/source/def/` – definitions
- `/source/ex/` – examples
- `/source/thm/` – theorems, lemmata and proofs; preferably proofs in separate files to allow for multiple proofs for the same statement
- `/source/snip/` – individual text snippets such as remarks, explanations etc.
- `/source/frag/` – individual document fragments, ideally only `\inputref`ing snippets, definitions, examples etc. in some desirable order
- `/source/tikz/` – tikz images, as individual `.tex`-files
- `/source/pic/` – image files.

3.2.3 MANIFEST.MF-Files

The `MANIFEST.MF` in the `META-INF`-directory consists of key-value-pairs, instructing \TeX (and associated software) of various properties of an archive. For example, the `MANIFEST.MF` of the `smglom/calculus`-archive looks like this:

```
id: smglom/calculus
source-base: http://mathhub.info/smglob/calculus
narration-base: http://mathhub.info/smglob/calculus
dependencies: smglom/arithmetics,smglom/sets,smglom/topology,
              smglom/mv,smglom/linear-algebra,smglom/algebra
responsible: Michael.Kohlhase@FAU.de
title: Elementary Calculus
teaser: Terminology for the mathematical study of change.
description: desc.html
```

Many of these are in fact ignored by \TeX , but some are important:

- `id`: The name of the archive, including its group (e.g. `smglom/calculus`),
- `source-base` or
 - `ns`: The namespace from which all symbol and module URIs in this repository are formed, see (TODO),
- `narration-base`: The namespace from which all document URIs in this repository are formed, see (TODO),
- `url-base`: The URL that is formed as a basis for *external references*, see (TODO),
- `dependencies`: All archives that this archive depends on. \TeX ignores this field, but MMT can pick up on them to resolve dependencies, e.g. for `lmh install`.

3.2.4 Using Files in \TeX Archives Directly

Several macros provided by \TeX allow for directly including files in repositories. These are:

$\backslash\text{mhinput}$	$\backslash\text{mhinput}$ [Some/Archive]{some/file} directly inputs the file some/file in the source-folder of Some/Archive.
----------------------------	---

$\backslash\text{inputref}$	$\backslash\text{inputref}$ [Some/Archive]{some/file} behaves like $\backslash\text{mhinput}$, but wraps the input in a $\backslash\text{begingroup} \dots \backslash\text{endgroup}$. When converting to xhtml , the file is not input at all, and instead an html -annotation is inserted that references the file. In the majority of cases $\backslash\text{inputref}$ is likely to be preferred over $\backslash\text{mhinput}$.
-----------------------------	---

$\backslash\text{ifinput}$	Both $\backslash\text{mhinput}$ and $\backslash\text{inputref}$ set $\backslash\text{ifinput}$ to “true” during input. This allows for selectively including e.g. bibliographies only if the current file is not being currently included in a larger document.
----------------------------	---

$\backslash\text{addmhbibresource}$	$\backslash\text{addmhbibresource}$ [Some/Archive]{some/file} searches for a file like $\backslash\text{mhinput}$ does, but calls $\backslash\text{addbibresource}$ to the result and looks for the file in the archive root directory directly, rather than the <code>source</code> directory.
-------------------------------------	---

$\backslash\text{libinput}$	$\backslash\text{libinput}$ {some/file} searches for a file some/file in <ul style="list-style-type: none">• the <code>lib</code>-directory of the current archive, and• the <code>lib</code>-directory of a <code>meta-inf</code>-archive in (any of) the archive groups containing the current archive and include all found files in reverse order; e.g. $\backslash\text{libinput}\{\text{preamble}\}$ in a <code>.tex</code> -file in <code>smglom/calculus</code> will <i>first</i> input <code>../smglom/meta-inf/lib/preamble.tex</code> and then <code>../smglom/calculus/lib/preamble.tex</code> . Will throw an error if <i>no</i> candidate for some/file is found.
-----------------------------	---

$\backslash\text{libusepackage}$	$\backslash\text{libusepackage}$ [package-options]{some/file} searches for a file some/file.sty in the same way that $\backslash\text{libinput}$ does, but will call $\backslash\text{usepackage}$ [package-options]{path/to/some/file} instead of $\backslash\text{input}$. Will throw an error if not <i>exactly one</i> candidate for some/file is found.
----------------------------------	--

Remark 3.2.1:

A good practice is to have individual \TeX fragments follow basically this document frame:

```
1 \documentclass{stex}
2 \libinput{preamble}
3 \begin{document}
4   ...
5   \ifinputref \else \libinput{postamble} \fi
6 \end{document}
```

Then the `preamble.tex` files can take care of loading the generally required packages, setting presentation customizations etc. (per archive or archive group or both), and `postamble.tex` can e.g. print the bibliography, index etc.

3.3 Module, Symbol and Notation Declarations

3.3.1 The `smodule`-Environment

`smodule` A new module is declared using the basic syntax

```
\begin{smodule}[options]{ModuleName}...\end{smodule}.
```

A module is required to declare any new formal content such as symbols or notations (but not variables, which may be introduced anywhere).

The `smodule`-environment takes several optional arguments, all of which are optional:

`title` ($\langle token list \rangle$) to display in customizations.

`type` ($\langle string \rangle *$) for use in customizations.

`deprecate` ($\langle module \rangle$) if set, will throw a warning when loaded, urging to use $\langle module \rangle$ instead.

`id` ($\langle string \rangle$) for cross-referencing.

`ns` ($\langle URI \rangle$) the namespace to use. *Should not be used, unless you know precisely what you're doing.* If not explicitly set, is computed using `\stex_modules_current_namespace:`.

`lang` ($\langle language \rangle$) if not set, computed from the current file name (e.g. `foo.en.tex`).

`sig` ($\langle language \rangle$) if the current file is a translation of a file with the same base name but a different language suffix, setting `sig=<lang>` will preload the module from that language file. This helps ensuring that the (formal) content of both modules is (almost) identical across languages and avoids duplication.

`creators` ($\langle string \rangle *$) names of the creators.

`contributors` ($\langle string \rangle *$) names of contributors.

`srccite` ($\langle string \rangle$) a source citation for the content of this module.

\hookrightarrow An \TeX module corresponds to an MMT/OMDOC *theory*. As such it
 \hookrightarrow gets assigned a module URI (*universal resource identifier*) of the form
 \hookrightarrow `<namespace>?<module-name>`.

By default, opening a module will produce no output whatsoever, e.g.:

Example 1

Input:

```

1 \begin{smodule}[title={This is Some Module}]{SomeModule}
2   Hello World
3 \end{smodule}

```

Output:

Hello World

\stexpatchmodule

We can customize this behavior either for all modules or only for modules with a specific type using the command `\stexpatchmodule[optional-type]{begin-code}{end-code}`. Some optional parameters are then available in `\smodule*`-macros, specifically `\smoduletitle`, `\smoduletype` and `\smoduleid`.

For example:

Example 2

Input:

```

1 \stexpatchmodule[display]
2   {\textbf{Module (\smoduletitle)}}\par
3   {\par\noindent\textbf{End of Module (\smoduletitle)}}
4
5 \begin{smodule}[type=display,title={Some New Module}]{SomeModule2}
6   Hello World
7 \end{smodule}

```

Output:

Module (Some New Module)
 Hello World
End of Module (Some New Module)

3.3.2 Declaring New Symbols and Notations

Inside an `smodule` environment, we can declare new \TeX symbols.

`\symdecl`

The most basic command for doing so is using `\symdecl{symbolname}`. This introduces a new symbol with name `symbolname`, arity 0 and semantic macro `\symbolname`.

The starred variant `\symdecl*{symbolname}` will declare a symbol, but not introduce a semantic macro. If we don't want to supply a notation (for example to introduce concepts like “abelian”, which is not something that has a notation), the starred variant is likely to be what we want.

\hookrightarrow `\symdecl` introduces a new OMDoc/MMT constant in the current module (=OMDoc/MMT theory). Correspondingly, they get assigned the URI `<module-URI>?<constant-name>`.

Without a semantic macro or a notation, the only meaningful way to reference a symbol is via `\symref`, `\symname` etc.

Example 3

Input:

```
1 \symdecl*{foo}
2 Given a \symname{foo}, we can...
```

Output:

Given a `foo`, we can...

Obviously, most semantic macros should take actual *arguments*, implying that the symbol we introduce is an *operator* or *function*. We can let `\symdecl` know the *arity* (i.e. number of arguments) of a symbol like this:

Example 4

Input:

```
1 \symdecl{binarysymbol}[args=2]
2 \symref{binarysymbol}{this} is a symbol taking two arguments.
```

Output:

`this` is a symbol taking two arguments.

`\notation`

In that case, we probably want to supply a notation as well, in which case we can finally actually use the semantic macro in math mode. We can do so using the `\notation` command, like this:

Example 5

Input:

```
1 \notation{binarysymbol}{\text{First: }#1\text{; Second: }#2}  
2 $\binarysymbol{a}{b}$
```

Output:

First: a ; Second: b

-  \rightarrow Applications of semantic macros, such as `\binarysymbol{a}{b}` are translated to
-  \rightarrow MMT/OMDOC as OMA-terms with head `<OMS name="...?binarysymbol"/>`.
-  \rightarrow Semantic macros with no arguments correspond to OMS directly.

`\comp`

Unfortunately, we have no highlighting whatsoever now. That is because we need to tell \TeX explicitly which parts of the notation are *notation components* which *should* be highlighted. We can do so with the `\comp` command.

We can introduce a new notation `highlight` for `\binarysymbol` that fixes this flaw, which we can subsequently use with `\binarysymbol[highlight]`:

Example 6

Input:

```
1 \notation{binarysymbol}[highlight]  
2 {\comp{\text{First: }}#1\comp{\text{; Second: }}#2}  
3 $\binarysymbol[highlight]{a}{b}$
```

Output:

First: a ; Second: b

Ideally, `\comp` would not be necessary: Everything in a notation that is *not* an argument should be a notation component. Unfortunately, it is computationally expensive to determine where an argument begins and ends, and the argument markers `#n` may themselves be nested in other macro applications or \TeX groups, making it ultimately almost impossible to determine them automatically while also remaining compatible with arbitrary highlighting customizations (such as tooltips, hyperlinks, colors) that users might employ, and that are ultimately invoked by `\comp`.

Note that it is required that

1. the argument markers `#n` never occur inside a `\comp`, and
2. no semantic arguments may ever occur inside a notation.

Both criteria are not just required for technical reasons, but conceptionally meaningful:

The underlying principle is that the arguments to a semantic macro represent *arguments to the mathematical operation* represented by a symbol. For example, a semantic macro `\addition{a}{b}` taking two arguments would represent *the actual addition of (mathematical objects) a and b*. It should therefore be impossible for *a* or *b* to be part of a notation component of `\addition`.

Similarly, a semantic macro can not conceptually be part of the notation of `\addition`, since a semantic macro represents a *distinct mathematical concept* with *its own semantics*, whereas notations are syntactic representations of the very symbol to which the notation belongs.

If you want an argument to a semantic macro to be a purely syntactic parameter, then you are likely somewhat confused with respect to the distinction between the precise *syntax* and *semantics* of the symbol you are trying to declare (which happens quite often even to experienced \LaTeX users), and might want to give those another thought - quite likely, the macro you aim to implement does not actually represent a semantically meaningful mathematical concept, and you will want to use `\def` and similar native \LaTeX macro definitions rather than semantic macros.

`\symdef`

In the vast majority of cases where a symbol declaration should come with a semantic macro, we will want to supply a notation immediately. For that reason, the `\symdef` command combines the functionality of both `\symdecl` and `\notation` with the optional arguments of both:

Example 7

Input:

```
1 \symdef{newbinarysymbol}[h1,args=2]
2   {\comp{\text{1.: }}#1\comp{\text{; 2.: }}#2}
3 $\newbinarysymbol{a}{b}$
```

Output:

1.: *a*; 2.: *b*

We just declared a new symbol `newbinarysymbol` with `args=2` and immediately provided it with a notation with identifier `h1`. Since `h1` is the *first* (and so far, only) notation supplied for `newbinarysymbol`, using `\newbinarysymbol` without optional argument defaults to this notation.

`\setnotation`

The first notation provided will stay the default notation unless explicitly changed – this is enabled by the `\setnotation` command: `\setnotation{symbolname}{notation-id}` sets the default notation of `\symbolname` to `notation-id`, i.e. henceforth, `\symbolname` behaves like `\symbolname[notation-id]` from now on.

Often, a default notation is set right after the corresponding notation is introduced – the starred version `\notation*` for that reason introduces a new notation and immediately sets it to be the new default notation. So expressed differently, the *first* `\notation` for a symbol behaves exactly like `\notation*`, and `\notation*{foo}[bar]{...}` behaves exactly like `\notation{foo}[bar]{...}\setnotation{foo}{bar}`.

Operator Notations

Once we have a semantic macro with arguments, such as `\newbinarysymbol`, the semantic macro represents the *application* of the symbol to a list of arguments. What if we want to refer to the operator *itself*, though?

We can do so by supplying the `\notation` (or `\symdef`) with an *operator notation*, indicated with the optional argument `op=`. We can then invoke the operator notation using `\symbolname![notation-identifier]`. Since operator notations never take arguments, we do not need to use `\comp` in it, the whole notation is wrapped in a `\comp` automatically:

Example 8

Input:

```
1 \notation{newbinarysymbol}[ab,
2 op={\text{a:}\cdot\text{; b:}\cdot}]
3 {\comp{\text{a:}}#1\comp{\text{; b:}}#2}
4 \symname{newbinarysymbol} is also occasionally written
5 $\newbinarysymbol![ab]$
```

Output:

`newbinarysymbol` is also occasionally written `a: · ; b: ·`

\hookrightarrow `\symbolname!` is translated to OMDoc/MMT as `<OMS name="...?symbolname"/>`
 \rightarrow directly.
 \rightsquigarrow `T`

3.3.3 Argument Types

The notations so far used *simple* arguments which we call *i-type* arguments. Declaring a new symbol with `\symdecl{foo}[args=3]` is equivalent to writing `\symdecl{foo}[args=iii]`, indicating that the semantic macro takes three *i-type* arguments. However, there are three more argument types which we will investigate now, namely *b-type*, *a-type* and *B-type* arguments.

b-Type Arguments

A **b-type** argument represents a *variable* that is *bound* by the symbol in its application, making the symbol a *binding operator*. Typical examples of binding operators are e.g. sums \sum , products \prod , integrals \int , quantifiers like \forall and \exists , that λ -operator, etc.

\hookrightarrow **b-type** arguments behave exactly like **i-type** arguments within $\text{\texttt{TeX}}$, but applications of binding operators, i.e. symbols with **b-type** arguments, are translated to $\text{\texttt{OMBIND}}$ -terms in $\text{\texttt{OMDOC/MTT}}$, rather than $\text{\texttt{OMA}}$.

For example, we can implement a summation operator binding an index variable and taking lower and upper index bounds and the expression to sum over like this:

Example 9

Input:

```
1 \symdef{summation}[args=biil]
2 {\mathop{\comp{sum}}_{\#1}\comp{=}\#2\sim\#3\#4}
3 $\summation{\svar{x}}{1}{\svar{n}}{\svar{x}}^2$
```

Output:

$$\sum_{x=1}^n x^2$$

where the variable x is now *bound* by the $\text{\texttt{summation}}$ -symbol in the expression.

a-Type Arguments

a-type arguments represent a *flexary argument sequence*, i.e. a sequence of arguments of arbitrary length. Formally, operators that take arbitrarily many arguments don't "exist", but in informal mathematics, they are ubiquitous. **a-type** arguments allow us to write e.g. $\text{\texttt{addition}}\{a,b,c,d,e\}$ rather than having to write something like $\text{\texttt{addition}}\{a\}\{\text{\texttt{addition}}\{b\}\{\text{\texttt{addition}}\{c\}\{\text{\texttt{addition}}\{d\}\{e\}\}\}\}$!

$\text{\texttt{notation}}$ (and consequently $\text{\texttt{symdef}}$, too) take one additional argument for each **a-type** argument that indicates how to "accumulate" a comma-separated sequence of arguments. This is best demonstrated on an example.

Let's say we want an operator representing quantification over an ascending chain of elements in some set, i.e. $\text{\texttt{ascendingchain}}\{S\}\{a,b,c,d,e\}\{t\}$ should yield $\forall a <_S b <_S c <_S d <_S e. t$. The "base"-notation for this operator is simply $\{\text{\texttt{comp}}\{\text{\texttt{forall}}\} \#2 \text{\texttt{comp}}\{.,\} \#3\}$, where $\#2$ represents the full notation fragment *accumulated* from $\{a,b,c,d,e\}$.

The *additional* argument to $\text{\texttt{notation}}$ (or $\text{\texttt{symdef}}$) takes the same arguments as the base notation and two *additional* arguments $\#1$ and $\#2$ representing successive pairs in the **a-type** argument, and accumulates them into $\#2$, i.e. to produce $a <_S b <_S c <_S d <_S e$, we do $\{\#1 \text{\texttt{comp}}\{<\} _ \#1\} \#2\}$:

Example 10

Input:

```

1 \symdef{ascendingchain}[args=iai]
2 {\comp{\forall} #2\comp{.\,}#3}
3 {##1 \comp{<}_#1} ##2}
4
5 Tadaa: $\ascendingchain{S}{a,b,c,d,e}{t}$

```

Output:

Tadaa: $\forall a <_S b <_S c <_S d <_S e. t$

If this seems overkill, keep in mind that you will rarely need the single-hash arguments #1,#2 etc. in the a-notation-argument. For a much more representative and simpler example, we can introduce flexary addition via:

Example 11

Input:

```

1 \symdef{addition}[args=a]{#1}{##1 \comp{+} ##2}
2
3 Tadaa: $\addition{a,b,c,d,e}$

```

Output:

Tadaa: $a+b+c+d+e$

The assoc-key We mentioned earlier that “formally”, flexary arguments don’t really “exist”. Indeed, formally, addition is usually defined as a binary operation, quantifiers bind a single variable etc.

Consequently, we can tell \LaTeX (or, rather, MMT/OMDOC) how to “resolve” flexary arguments by providing `\symdecl` or `\symdef` with an optional `assoc`-argument, as in `\symdecl{addition}[args=a,assoc=bin]`. The possible values for the `assoc`-key are:

bin: A binary, associative argument, e.g. as in `\addition`

binl: A binary, left-associative argument, e.g. $a^{b^{c^d}}$, which stands for $((a^b)^c)^d$

binr: A binary, right-associative argument, e.g. as in $A \rightarrow B \rightarrow C \rightarrow D$, which stands for $A \rightarrow (B \rightarrow (C \rightarrow D))$

pre: Successively prefixed, e.g. as in $\forall x. y. z. P$, which stands for $\forall x. \forall y. \forall z. P$

conj: Conjunctive, e.g. as in $a = b = c = d$ or $a, b, c, d \in A$, which stand for $a = d \wedge b = d \wedge c = d$ and $a \in A \wedge b \in A \wedge c \in A \wedge d \in A$, respectively

pwconj: Pairwise conjunctive, e.g. as in $a \neq b \neq c \neq d$, which stands for $a \neq b \wedge a \neq c \wedge a \neq d \wedge b \neq c \wedge b \neq d \wedge c \neq d$

B-Type Arguments

Finally, B-type arguments simply combine the functionality of both `a` and `b` - i.e. they represent an arbitrarily long sequence of variables to be bound, e.g. for implementing quantifiers:

Example 12

Input:

```
1 \symdef{quantforall}[args=Bi]
2 {\comp{\forall}#1\comp{.}#2}
3 {##1\comp,##2}
4
5 $\quantforall{\svar{x},\svar{y},\svar{z}}{P}$
```

Output:

$\forall x,y,z.P$

3.3.4 Type and Definiens Components

`\symdecl` and `\symdef` take two more optional arguments. \TeX largely ignores them (except for special situations we will talk about later), but MMT can pick up on them for additional services. These are the `type` and `def` keys, which expect expressions in math-mode (ideally using semantic macros, of course!)

The `type` and `def` keys correspond to the `type` and `definiens` components of

- \hookrightarrow OMDoc/MMT constants.
- \rightarrow Correspondingly, the name “type” should be taken with a grain of salt, since
- \rightarrow OMDoc/MMT – being foundation-independent – does not a priori implement a fixed typing system.

The `type`-key allows us to provide additional information (given the necessary \TeX symbols), e.g. for addition on natural numbers:

Example 13

Input:

```
1 \symdef{Nat}[type=\set]{\comp{\mathbb N}}
2 \symdef{addition}[
3   type=\funtype{\Nat,\Nat}{\Nat},
4   op=+,
5   args=a
6 ]{\#1}{\#1 \comp+ \#2}
7
8 \symname{addition} is an operation $\funtype{\Nat,\Nat}{\Nat}$
```

Output:

`addition` is an operation $\mathbb{N} \times \mathbb{N} \rightarrow \mathbb{N}$

The `def`-key allows for declaring symbols as abbreviations:

Example 14

Input:

```

1 \symdef{successor}[
2   type=\funtype{\Nat}{\Nat},
3   def=\fun{\svar{x}}{\addition{\svar{x},1}},
4   op=\mathtt{succ},
5   args=1
6 ]{\comp{\mathtt{succ}{}#1\comp{}}}
7
8 The \symname{successor} operation $\funtype{\Nat}{\Nat}$
9 is defined as $\fun{\svar{x}}{\addition{\svar{x},1}}$

```

Output:

The `successor` operation $\mathbb{N} \rightarrow \mathbb{N}$ is defined as $x \mapsto x+1$

3.3.5 Precedences and Automated Bracketing

Having done `\addition`, the obvious next thing to implement is `\multiplication`. This is in theory straight-forward:

Example 15

Input:

```

1 \symdef{multiplication}[
2   type=\funtype{\Nat,\Nat}{\Nat},
3   op=\cdot,
4   args=a
5 ]{\#1}{\#1 \comp\cdot \#2}
6
7 \symname{multiplication} is an operation $\funtype{\Nat,\Nat}{\Nat}$

```

Output:

`multiplication` is an operation $\mathbb{N} \times \mathbb{N} \rightarrow \mathbb{N}$

However, if we *combine* `\addition` and `\multiplication`, we notice a problem:

Example 16

Input:

```

1 $\addition{a,\multiplication{b,\addition{c,\multiplication{d,e}}}}$

```

Output:

$a+b \cdot c+d \cdot e$

We all know that \cdot binds stronger than $+$, so the output $a+b\cdot c+d\cdot e$ does not actually reflect the term we wrote. We can of course insert parentheses manually

Example 17

Input:

```
1 $ \addition{a, \multiplication{b, (\addition{c, \multiplication{d, e}})}}$
```

Output:

$$a+b\cdot(c+d\cdot e)$$

but we can also do better by supplying *precedences* and have \TeX insert parentheses automatically.

For that purpose, `\notation` (and hence `\symdef`) take an optional argument `prec=<opprec>;<argprec1>x...x<argprec n>`.

We will investigate the precise meaning of `<opprec>` and the `<argprec>`s shortly – in the vast majority of cases, it is perfectly sufficient to think of `prec=` taking a single number and having that be *the* precedence of the notation, where lower precedences (somewhat counterintuitively) bind stronger than higher precedences. So fixing our notations for `\addition` and `\multiplication`, we get:

Example 18

Input:

```
1 \notation{multiplication}[
2   op=\cdot,
3   prec=50
4 ]{#1}{##1 \comp\cdot ##2}
5 \notation{addition}[
6   op=+,
7   prec=100
8 ]{#1}{##1 \comp+ ##2}
9
10 $ \addition{a, \multiplication{b, \addition{c, \multiplication{d, e}}}}$
```

Output:

$$a+b\cdot(c+d\cdot e)$$

Note that the precise numbers used for precedences are pretty arbitrary – what matters is which precedences are higher than which other precedences when used in conjunction.

`\infprec`
`\neginfprec`

It is occasionally useful to have “infinitely” high or low precedences to enforce or forbid automated bracketing entirely – for those purposes, `\infprec` and `\neginfprec` exist (which are implemented as the maximal and minimal integer values accordingly).

More precisely, each notation takes

1. One *operator precedence* and

2. one *argument precedence* for each argument.

By default, all precedences are 0, unless the symbol takes no argument, in which case the operator precedence is `\neginfprec` (negative infinity). If we only provide a single number, this is taken as both the operator precedence and all argument precedences.

$\text{\texttt{gT\TeX}}$ decides whether to insert parentheses by comparing operator precedences to a *downward precedence* p_d with initial value `\infprec`. When encountering a semantic macro, $\text{\texttt{gT\TeX}}$ takes the operator precedence p_{op} of the notation used and checks whether $p_{op} > p_d$. If so, $\text{\texttt{gT\TeX}}$ insert parentheses.

When $\text{\texttt{gT\TeX}}$ steps into an argument of a semantic macro, it sets p_d to the respective argument precedence of the notation used.

In the example above:

1. $\text{\texttt{gT\TeX}}$ starts out with $p_d = \text{\texttt{\neginfprec}}$.
2. $\text{\texttt{gT\TeX}}$ encounters `\addition` with $p_{op} = 100$. Since $100 \not> \text{\texttt{\neginfprec}}$, it inserts no parentheses.
3. Next, $\text{\texttt{gT\TeX}}$ encounters the two arguments for `\addition`. Both have no specifically provided argument precedence, so $\text{\texttt{gT\TeX}}$ uses $p_d = p_{op} = 100$ for both and recurses.
4. Next, $\text{\texttt{gT\TeX}}$ encounters `\multiplication{b,...}`, whose notation has $p_{op} = 50$.
5. We compare to the current downward precedence p_d set by `\addition`, arriving at $p_{op} = 50 \not> 100 = p_d$, so $\text{\texttt{gT\TeX}}$ again inserts no parentheses.
6. Since the notation of `\multiplication` has no explicitly set argument precedences, $\text{\texttt{gT\TeX}}$ uses the operator precedence for all arguments of `\multiplication`, hence sets $p_d = p_{op} = 50$ and recurses.
7. Next, $\text{\texttt{gT\TeX}}$ encounters the inner `\addition{c,...}` whose notation has $p_{op} = 100$.
8. We compare to the current downward precedence p_d set by `\multiplication`, arriving at $p_{op} = 100 > 50 = p_d$ – which finally prompts $\text{\texttt{gT\TeX}}$ to insert parentheses, and we proceed as before.

3.3.6 Variables

All symbol and notation declarations require a module with which they are associated, hence the commands `\symdecl`, `\notation`, `\symdef` etc. are disabled outside of `smodule`-environments.

Variables are different – variables are allowed everywhere, are not exported when the current module (if one exists) is imported (via `\importmodule` or `\usemodule`) and (also unlike symbol declarations) “disappear” at the end of the current $\text{\texttt{T\TeX}}$ group.

`\svar`

So far, we have always used variables using `\svar{n}`, which marks-up n as a variable with name n . More generally, `\svar[foo]{<texcode>}` marks-up the arbitrary `<texcode>` as representing a variable with name `foo`.

Of course, this makes it difficult to reuse variables, or introduce “functional” variables with arities > 0 , or provide them with a type or definiens.

\vardef

For that, we can use the `\vardef` command. Its syntax is largely the same as that of `\symdef`, but unlike symbols, variables have only one notation (**TODO: so far?**), hence there is only `\vardef` and no `\vardecl`.

Example 19

Input:

```
1 \vardef{varf}[
2   name=f,
3   type=\funtype{\Nat}{\Nat},
4   op=f,
5   args=1,
6   prec=0;\neginfp
7 ]{\comp{f}#1}
8 \vardef{varn}[name=n,type=\Nat]{\comp{n}}
9 \vardef{varx}[name=x,type=\Nat]{\comp{x}}
10
11 Given a function $\varf!:\funtype{\Nat}{\Nat}$,
12 by $\addition{\varf!,\varn}$ we mean the function
13 $\fun{\varx}{\varf{\addition{\varx,\varn}}}$
```

Output:

Given a function $f : \mathbb{N} \rightarrow \mathbb{N}$, by $f+n$ we mean the function $x \mapsto f(x+n)$

(of course, “lifting” addition in the way described in the previous example is an operation that deserves its own symbol rather than abusing `\addition`, but... well.)

TODO: bind=forall/exists

3.3.7 Variable Sequences

Variable *sequences* occur quite frequently in informal mathematics, hence they deserve special support. Variable sequences behave like variables in that they disappear at the end of the current $\text{T}_\text{E}\text{X}$ group and are not exported from modules, but their declaration is quite different.

\varseq

A variable sequence is introduced via the command `\varseq`, which takes the usual optional arguments `name` and `type`. It then takes a starting index, an end index and a *notation* for the individual elements of the sequence parametric in an index.

This is best shown by example:

Example 20

Input:

```
1 \vardef{varn}[name=n,type=\Nat]{\comp{n}}
2 \varseq{seqa}[name=a,type=\Nat]{1}{\varn}{\comp{a}_{#1}}
3
4 The $i$th index of $\seqa!$ is $\seqa{i}$.
```

Output:

The i th index of a_1, \dots, a_n is a_i .

Note that the syntax `\seqa!` now automatically generates a presentation based on the starting and ending index.

TODO: more notations for invoking sequences.

Notably, variable sequences are nicely compatible with **a**-type arguments, so we can do the following:

Example 21

Input:

```
1 \addition{\seqa}
```

Output:

$$a_1 + \dots + a_n$$

Sequences can be *multidimensional* using the **args**-key, in which case the notation's arity increases and starting and ending indices have to be provided as a comma-separated list:

Example 22

Input:

```
1 \vardef{varm}[name=m,type=\Nat]{\comp{m}}
2 \varseq{seqa}[
3   name=a,
4   args=2,
5   type=\Nat,
6 ]{1,1}{\varn,\varm}{\comp{a}_{#1}^{#2}}
7
8 \seqa! and \addition{\seqa}
```

Output:

$$a_1^1, \dots, a_n^m \text{ and } a_1^1 + \dots + a_n^m$$

We can also explicitly provide a “middle” segment to be used, like such:

Example 23

Input:

```
1 \varseq{seqa}[
2   name=a,
3   type=\Nat,
4   args=2,
5   mid={\comp{a}_{\varn}^1,\comp{a}_1^2,\ellipses,\comp{a}_{1}^{\varm}}
6 ]{1,1}{\varn,\varm}{\comp{a}_{#1}^{#2}}
7
8 \seqa! and \addition{\seqa}
```

Output:

$$a_1^1, \dots, a_n^1, a_1^2, \dots, a_1^m, \dots, a_n^m \text{ and } a_1^1 + \dots + a_n^1 + a_1^2 + \dots + a_1^m + \dots + a_n^m$$

3.4 Module Inheritance and Structures

3.4.1 Multilinguality and Translations

If we load the \TeX document class or package with the option `lang=<lang>`, \TeX will load the appropriate `babel` language for you – e.g. `lang=de` will load the `babel` language `ngerman`. Additionally, it makes \TeX aware of the current document being set in (in this example) *german*. This matters for reasons other than mere `babel`-purposes, though:

Every *module* is assigned a language. If no \TeX package option is set that allows for inferring a language, \TeX will check whether the current file name ends in e.g. `.en.tex` (or `.de.tex` or `.fr.tex`, or...) and set the language accordingly. Alternatively, a language can be explicitly assigned via `\begin{smodule}[lang=<language>]{Foo}`.

Technically, each `smodule`-environment induces *two* OMDoc/MMT theories:
 $\begin{array}{ll} \text{---M---} & \text{\begin{smodule}[lang=<lang>]{Foo} generates a theory some/namespace?Foo} \\ \text{---M---} & \text{that only contains the “formal” part of the module – i.e. exactly the content} \\ \text{---T---} & \text{that is exported when using \importmodule.} \\ \text{---T---} & \text{Additionally, MMT generates a language theory some/namespace/Foo?<lang> that} \\ & \text{includes some/namespace?Foo and contains all the other document content – vari-} \\ & \text{able declarations, includes for each \usemodule, etc.} \end{array}$

Notably, the language suffix in a filename is ignored for `\usemodule`, `\importmodule` and in generating/computing URIs for modules. This however allows for providing *translations* for modules between languages without needing to duplicate content:

If a module `Foo` exists in e.g. *english* in a file `Foo.en.tex`, we can provide a file `Foo.de.tex` right next to it, and write `\begin{smodule}[sig=en]{Foo}`. The `sig`-key then signifies, that the “signature” of the module is contained in the *english* version of the module, which is immediately imported from there, just like `\importmodule` would.

Additionally to translating the informal content of a module file to different languages, it also allows for customizing notations between languages. For example, the *least common multiple* of two numbers is often denoted as $\text{lcm}(a, b)$ in *english*, but is called *kleinstes gemeinsames Vielfaches* in *german* and consequently denoted as $\text{kgV}(a, b)$ there.

We can therefore imagine a *german* version of an `lcm`-module looking something like this:

```
1 \begin{smodule}[sig=en]{lcm}
2   \notation*{lcm}[de]{\comp{\mathtt{kgV}}}{\#1,\#2}
3
4   Das \symref{lcm}{kleinste gemeinsame Vielfache}
5   $\text{lcm}\{a,b\}$ von zwei Zahlen $a,b$ ist...
6 \end{smodule}
```

If we now do `\importmodule{lcm}` (or `\usemodule{lcm}`) within a *german* document, it will also load the content of the *german* translation, including the `de`-notation for `\lcm`.

3.4.2 Simple Inheritance and Namespaces

`\importmodule`
`\usemodule`

`\importmodule`[Some/Archive]{path?ModuleName} is only allowed within an `smodule`-environment and makes the symbols declared therein available. Additionally the content of ModuleName will be exported if the current module is imported somewhere else via `\importmodule`.

`\usemodule` behaves the same way, but without exporting the content of the used module.

It is worth going into some detail how exactly `\importmodule` and `\usemodule` resolve their arguments to find the desired module – which is closely related to the *namespace* generated for a module, that is used to generate its URI.

Ideally, \TeX would use arbitrary URIs for modules, with no forced relationships between the *logical* namespace of a module and the *physical* location of the file declaring the module – like MMT does things.

Unfortunately, \TeX only provides very restricted access to the file system, so we are forced to generate namespaces systematically in such a way that they reflect the physical location of the associated files, so that \TeX can resolve them accordingly. Largely, users need not concern themselves with namespaces at all, but for completeness sake, we describe how they are constructed:

- If `\begin{smodule}{Foo}` occurs in a file `/path/to/file/Foo[.<lang>].tex` which does not belong to an archive, the namespace is `file://path/to/file`.
- If the same statement occurs in a file `/path/to/file/bar[.<lang>].tex`, the namespace is `file://path/to/file/bar`.

In other words: outside of archives, the namespace corresponds to the file URI with the filename dropped iff it is equal to the module name, and ignoring the (optional) language suffix.

If the current file is in an archive, the procedure is the same except that the initial segment of the file path up to the archive's `source`-folder is replaced by the archive's namespace URI.

Conversely, here is how namespaces/URIs and file paths are computed in import statements, exemplary `\importmodule`:

- `\importmodule{Foo}` outside of an archive refers to module `Foo` in the current namespace. Consequently, `Foo` must have been declared earlier in the same document or, if not, in a file `Foo[.<lang>].tex` in the same directory.
- The same statement *within* an archive refers to either the module `Foo` declared earlier in the same document, or otherwise to the module `Foo` in the archive's top-level namespace. In the latter case, it has to be declared in a file `Foo[.<lang>].tex` directly in the archive's `source`-folder.
- Similarly, in `\importmodule{some/path?Foo}` the path `some/path` refers to either the sub-directory and relative namespace path of the current directory and namespace outside of an archive, or relative to the current archive's top-level namespace and `source`-folder, respectively.

The module `Foo` must either be declared in the

file $\langle top-directory \rangle / some/path/Foo[. \langle lang \rangle].tex$, or in $\langle top-directory \rangle / some/path[. \langle lang \rangle].tex$ (which are checked in that order).

- Similarly, `\importmodule[Some/Archive]{some/path?Foo}` is resolved like the previous cases, but relative to the archive `Some/Archive` in the mathhub-directory.
- Finally, `\importmodule{full://uri?Foo}` naturally refers to the module `Foo` in the namespace `full://uri`. Since the file this module is declared in can not be determined directly from the URI, the module must be in memory already, e.g. by being referenced earlier in the same document. Since this is less compatible with a modular development, using full URIs directly is strongly discouraged, unless the module is declared in the current file directly.

`\STEXexport`

`\importmodule` and `\usemodule` import all symbols, notations, semantic macros and (recursively) `\importmodules`. If you want to additionally export e.g. convenience macros and other code from a module, you can use the command `\STEXexport{<code>}` in your module. Then `<code>` is executed (both immediately and) every time the current module is opened via `\importmodule` or `\usemodule`.

Note, that `\newcommand` defines macros *globally* and throws an error if the macro already exists, potentially leading to low-level L^AT_EX errors if we put a `\newcommand` in an `\STEXexport` and the `<code>` is executed more than once in a document – which can happen easily.

A safer alternative is to use macro definition principles, that are safe to use even if the macro being defined already exists, and ideally are local to the current T_EX group, such as `\def` or `\let`.

3.4.3 The `mathstructure` Environment

A common occurrence in mathematics is bundling several interrelated “declarations” together into *structures*. For example:

- A *monoid* is a structure $\langle M, \circ, e \rangle$ with $\circ : M \times M \rightarrow M$ and $e \in M$ such that...
- A *topological space* is a structure $\langle X, \mathcal{T} \rangle$ where X is a set and \mathcal{T} is a topology on X
- A *partial order* is a structure $\langle S, \leq \rangle$ where \leq is a binary relation on S such that...

This phenomenon is important and common enough to warrant special support, in particular because it requires being able to *instantiate* such structures (or, ratherer, structure *signatures*) in order to talk about (concrete or variable) *particular* monoids, topological spaces, partial orders etc.

`mathstructure` The `mathstructure` environment allows us to do exactly that. It behaves exactly like the `smodule` environment, but is itself only allowed inside an `smodule` environment, and allows for instantiation later on.

How this works is again best demonstrated by example:

Example 24

Input:

```

1 \begin{mathstructure}{monoid}
2   \symdef{universe}[type=\set]{\comp{U}}
3   \symdef{op}[
4     args=2,
5     type=\funtype{\universe,\universe}{\universe},
6     op=\circ
7   ]{##1 \comp{\circ} ##2}
8   \symdef{unit}[type=\universe]{\comp{e}}
9 \end{mathstructure}
10
11 A \symname{monoid} is...
```

Output:

A **monoid** is...

Note that the `\symname{monoid}` is appropriately highlighted and (depending on your pdf viewer) shows a URI on hovering – implying that the `mathstructure` environment has generated a *symbol* monoid for us. It has not generated a semantic macro though, since we can not use the monoid-symbol *directly*. Instead, we can instantiate it, for example for integers:

Example 25

Input:

```

1 \symdef{Int}[type=\set]{\comp{\mathbb Z}}
2 \symdef{addition}[
3   type=\funtype{\Int,\Int}{\Int},
4   args=2,
5   op=+
6 ]{##1 \comp{+} ##2}
7 \symdef{zero}[type=\Int]{\comp{0}}
8
9 $\mathstruct{\Int,\addition!,\zero}$ is a \symname{monoid}.
```

Output:

$\langle \mathbb{Z}, +, 0 \rangle$ is a **monoid**.

So far, we have not actually instantiated monoid, but now that we have all the symbols to do so, we can:

Example 26

Input:

```

1 \instantiate{intmonoid}{
2   universe = Int ,
3   op = addition ,
4   unit = zero
5 }{monoid}{\mathbb{Z}_{+,0}}
6
7 $\intmonoid{universe}$, $\intmonoid{unit}$ and $\intmonoid{op}{a}{b}$.
8
9 Also: $\intmonoid!$

```

Output:

\mathbb{Z} , 0 and $a+b$.
Also: $\mathbb{Z}_{+,0}$

`\instantiate`

So summarizing: `\instantiate` takes four arguments: The (macro-)name of the instance, a key-value pair assigning declarations in the corresponding `mathstructure` to symbols currently in scope, the name of the `mathstructure` to instantiate, and lastly a notation for the instance itself.

It then generates a semantic macro that takes as argument the name of a declaration in the instantiated `mathstructure` and resolves it to the corresponding instance of that particular declaration.

`\instantiate` and `mathstructure` make use of the *Theories-as-Types* paradigm: `mathstructure{<name>}` does in fact simply create a nested theory with name `<name>-structure`. The *constant* `<name>` is defined as `Mod(<name>-structure)` – a *dependent record type with manifest fields*, the fields of which are generated from (and correspond to) the constants in `<name>-structure`.
 $\hookrightarrow M$ `\instantiate` appropriately generates a constant whose definiens is a record term of type `Mod(<name>-structure)`, with the fields assigned appropriately based on the key-value-list.

Notably, `\instantiate` throws an error if not *every* declaration in the instantiated `mathstructure` is being assigned.

You might consequently ask what the usefulness of `mathstructure` even is.

`\varinstantiate`

The answer is that we can also instantiate a `mathstructure` with a *variable*. The syntax of `\varinstantiate` is equivalent to that of `\instantiate`, but all of the key-value-pairs are optional, and if not explicitly assigned (to a symbol *or* a variable declared with `\vardef`) inherit their notation from the one in the `mathstructure` environment.

This allows us to do things like:

Example 27

Input:

```

1 \varinstantiate{varM}{\monoid}{M}
2
3 A \symname{monoid} is a structure
4 $\varM!:=\mathstrut{\varM{universe},\varM{op}!,\varM{unit}}{\varM{op}!:\funtype{\varM{universe},\varM{universe}}{\varM{universe}}}$
5 such that
6 $\varM{op}!:\funtype{\varM{universe},\varM{universe}}{\varM{universe}}$
7 and...
8
9 \varinstantiate{varMb}{universe = Int}{monoid}{M_2}
10
11 \noindent Let $\varMb!:=\mathstrut{\varMb{universe},\varMb{op}!,\varMb{unit}}{\varMb{op}!:\funtype{\varMb{universe},\varMb{universe}}{\varMb{universe}}}$
12 a \symname{monoid} on $\Int$...

```

Output:

A **monoid** is a structure $M := \langle U, \circ, e \rangle$ such that $\circ : U \times U \rightarrow U$ and...
 Let $M_2 := \langle \mathbb{Z}, \circ, e \rangle$ a **monoid** on \mathbb{Z} ...

We will return to this example later, when we also know how to handle the *axioms* of a monoid.

3.4.4 The copymodule Environment

TODO: explain

Given modules:

Example 28

Input:

```

1 \begin{smodule}{magma}
2   \symdef{universe}{\comp{\mathcal U}}
3   \symdef{operation}[args=2,op=\circ]{\#1 \comp\circ \#2}
4 \end{smodule}
5 \begin{smodule}{monoid}
6   \importmodule{magma}
7   \symdef{unit}{\comp e}
8 \end{smodule}
9 \begin{smodule}{group}
10  \importmodule{monoid}
11  \symdef{inverse}[args=1]{\#1\comp{-1}}
12 \end{smodule}

```

Output:

We can form a module for *rings* by “cloning” an instance of **group** (for addition) and **monoid** (for multiplication), respectively, and “glueing them together” to ensure they share the same universe:

Example 29

Input:

```

1 \begin{smodule}{ring}
2   \begin{copymodule}{group}{addition}
3     \renamedecl[name=universe]{universe}{runiverse}
4     \renamedecl[name=plus]{operation}{rplus}
5     \renamedecl[name=zero]{unit}{rzero}
6     \renamedecl[name=uminus]{inverse}{ruminus}
7   \end{copymodule}
8   \notation*{rplus}[plus,op=+,prec=60]{#1 \comp+ #2}
9   \notation*{rzero}[zero]{\comp0}
10  \notation*{ruminus}[uminus,op=-]{\comp- #1}
11  \begin{copymodule}{monoid}{multiplication}
12    \assign{universe}{\runiverse}
13    \renamedecl[name=times]{operation}{rtimes}
14    \renamedecl[name=one]{unit}{rone}
15  \end{copymodule}
16  \notation*{rtimes}[cdot,op=\cdot,prec=50]{#1 \comp\cdot #2}
17  \notation*{rone}[one]{\comp1}
18  Test: $\rtimes a\{rplus c\{rtimes de\}}$
19 \end{smodule}

```

Output:

Test: $a \cdot (c + d \cdot e)$

TODO: explain donotclone

3.4.5 The interpretmodule Environment

TODO: explain

Example 30

Input:

```

1 \begin{smodule}{int}
2   \symdef{Integers}{\comp{\mathbb Z}}
3   \symdef{plus}[args=2,op=+]{#1 \comp+ #2}
4   \symdef{zero}{\comp0}
5   \symdef{uminus}[args=1,op=-]{\comp-#1}
6
7   \begin{interpretmodule}{group}{intisgroup}
8     \assign{universe}{\Integers}
9     \assign{operation}{\plus!}
10    \assign{unit}{\zero}
11    \assign{inverse}{\uminus!}
12  \end{interpretmodule}
13 \end{smodule}

```

Output:

3.5 Primitive Symbols (The \TeX Metatheory)

TODO: metatheory documentation

Chapter 4

Using \TeX Symbols

Given a symbol declaration `\symdecl{symbolname}`, we obtain a semantic macro `\symbolname`. We can use this semantic macro in math mode to use its notation(s), and we can use `\symbolname!` in math mode to use its operator notation(s). What else can we do?

4.1 `\symref` and its variants

`\symref`
`\symname`

We have already seen `\symname` and `\symref`, the latter being the more general.

`\symref{<symbolname>}{<code>}` marks-up `<code>` as referencing `<symbolname>`. Since quite often, the `<code>` should be (a variant of) the name of the symbol anyway, we also have `\symname{<symbolname>}`.

Note that `\symname` uses the *name* of a symbol, not its macroname. More precisely, `\symname` will insert the name of the symbol with “-” replaced by spaces. If a symbol does not have an explicit `name=` given, the two are equal – but for `\symname` it often makes sense to make the two explicitly distinct. For example:

Example 31

Input:

```
1 \symdef{Nat}[
2   name=natural-number,
3   type=\set
4 ]{\comp{\mathbb{N}}}
5
6 A \symname{Nat} is...
```

Output:

A natural number is...

`\symname` takes two additional optional arguments, `pre=` and `post=` that get prepended or appended respectively to the symbol name.

`\Symname`

Additionally, `\Symname` behaves exactly like `\symname`, but will capitalize the first letter of the name:

Example 32

Input:

```
1 \Symname[post=s]{Nat} are...
```

Output:

Natural numbers are...

This is as good a place as any other to explain how \TeX resolves a string `symbolname` to an actual symbol.

If `\symbolname` is a semantic macro, then \TeX has no trouble resolving `symbolname` to the full URI of the symbol that is being invoked.

However, especially in `\symname` (or if a symbol was introduced using `\symdecl*` without generating a semantic macro), we might prefer to use the *name* of a symbol directly for readability – e.g. we would want to write `A \symname{natural-number} is...` rather than `A \symname{Nat} is...`. \TeX attempts to handle this case thusly:

If `string` does *not* correspond to a semantic macro `\string`, then \TeX checks all symbols currently in scope until it finds one, whose full URI ends with `string`. This allows for disambiguating more precisely, e.g. by saying `\symname{Integers?addition}` or `\symname{RealNumbers?addition}` in the case where several `additions` are in scope.

However, this also means that if we have symbols `foo` and e.g. `miraculous-foo`, then \TeX might resolve `\symname{foo}` to `miraculous-foo` if it finds this symbol first. It is therefore a good idea to prefix symbol names with a `?`, thus ensuring that \TeX will find the symbol `...?foo` rather than `...?miraculous-foo`.

4.2 Marking Up Text and On-the-Fly Notations

We can also use semantic macros outside of text mode though, which allows us to annotate arbitrary text fragments.

Let us assume again, that we have `\symdef{addition}[args=2]{#1 \comp+ #2}`. Then we can do

Example 33

Input:

```
1 \addition{\comp{The sum of} \arg{${\svar{n}}$} \comp{ and } \arg{${\svar{m}}$}}
2 is...
```

Output:

The sum of n and m is...

...which marks up the text fragment as representing an *application* of the `addition`-symbol to two argument n and m .

\hookrightarrow As expected, the above example is translated to OMDOC/MMT as an
 \rightarrow OMA with `<OMS name="...?addition"/>` as head and `<OMV name="n"/>` and
 \rightsquigarrow `<OMV name="m"/>` as arguments.

\arg

In text mode, every semantic macro takes exactly one argument, namely the text-fragment to be annotated. The `\arg` command is only valid within the argument to a semantic macro and marks up the *individual arguments* for the symbol.

We can also use semantic macros in text mode to invoke an operator itself instead of its application, with the usual syntax using `!`:

Example 34

Input:

```
1 \addition!{Addition} is...
```

Output:

Addition is...

In deed, `\symbolname!{<code>}` is exactly equivalent to `\symref{symbolname}{<code>}` (the latter is in fact implemented in terms of the former).

`\arg` also allows us to switch the order of arguments around and “hide” arguments: For example, `\arg[3]{<code>}` signifies that `<code>` represents the *third* argument to the current operator, and `\arg*[i]{<code>}` signifies that `<code>` represents the *i*th argument, but it should not produce any output (it is exported in the `xhtml` however, so that MMT and other systems can pick up on it)

Example 35

Input:

```
1 \addition{\comp{adding}
2 \arg[2]{\svar{k}}
3 \arg*{\svar{n}}{\svar{m}}} yields...
```

Output:

adding k yields...

Note that since the second `\arg` has no explicit argument number, it automatically represents the first not-yet-given argument – i.e. in this case the first one.

The same syntax can be used in math mode, too, which allows us to spontaneously introduce new notations on the fly. We can activate it using the starred variants of semantic macros:

Example 36

Input:

```
1 Given $\addition{\svar{n}}{\svar{m}}$, then
2 $\addition*{
3   \arg*{\addition{\svar{n}}{\svar{m}}}
4   \comp{+}
5   \arg{\svar{k}}
6 }$ yields...
```

Output:

Given $n+m$, then $+k$ yields...

4.3 Referencing Symbols and Statements

TODO: references documentation

Chapter 5

sTeX Statements

5.1 Definitions, Theorems, Examples, Paragraphs

As mentioned earlier, we can semantically mark-up *statements* such as definitions, theorems, lemmata, examples, etc.

The corresponding environments for that are:

- `sdefinition` for definitions,
- `sassertion` for assertions, i.e. propositions that are declared to be *true*, such as theorems, lemmata, axioms,
- `sexample` for examples, and
- `sparagraph` for other semantic paragraphs, such as comments, remarks, conjectures, etc.

The *presentation* of these environments can be customized to use e.g. predefined theorem-environments, see [chapter 6](#) for details.

All of these environments take optional arguments in the form of `key=value`-pairs. Common to all of them are the keys `id=` (for cross-referencing, see [section 4.3](#)), `type=` for customization (see [chapter 6](#)) and additional information (e.g. definition principles, “difficulty” etc), `title=`, and `for=`.

The `for=` key expects a comma-separated list of existing symbols, allowing for e.g. things like

Example 37

Input:

```
1 \begin{sexample}[
2   id=additionandmultiplication.ex,
3   for={addition,multiplication},
4   type={trivial,boring},
5   title={An Example}
6 ]
7   $\addition{2,3}$ is $5$, $\multiplication{2,3}$ is $6$.
8 \end{sexample}
```

Output:

Example 5.1.1 (An Example). $2+3$ is 5, $2\cdot 3$ is 6.

`\definiendum`
`\definame`
`\definiens`
`\Definame`

`sdefinition` (and `sparagraph` with `type=symdoc`) introduce three new macros: `definiendum` behaves like `symref` (and `definame/Definame` like `symname/Symname`, respectively), but highlights the referenced symbol as *being defined* in the current definition.

`\definiens`[<optional symbolname>]{<code>} marks up <code> as being the explicit *definiens* of <optional symbolname> (in case `for=` has multiple symbols).

- \hookrightarrow The special `type=symdoc` for `sparagraph` is intended to be used for “informal definitions”, or encyclopedia-style descriptions for symbols.
- \hookrightarrow The MMT-system can use those (in lieu of an actual `sdefinition` in scope) to present to users, e.g. when hovering over symbols.

All four environments also take an optional parameter `name=` – if this one is given a value, the environment will generate a *symbol* by that name (but with no semantic macro). Not only does this allow for `\symref` et al, it allows us to resume our earlier example for monoids much more nicely:

Example 38

Input:

```

1 \begin{mathstructure}{monoid}
2   \symdef{universe}[type=\set]{\comp{U}}
3   \symdef{op}[
4     args=2,
5     type=\funtype{\universe,\universe}{\universe},
6     op=\circ
7   ]{\#1 \comp{\circ} \#2}
8   \symdef{unit}[type=\universe]{\comp{e}}
9
10  \begin{sparagraph}[type=symdoc,for=monoid]
11    A \definame{monoid} is a structure
12    $\mathstruct{\universe,\op!,\unit}$
13    where $\op!: \funtype{\universe}{\universe}$ and
14    $\inset{\unit}{\universe}$ such that
15
16    \begin{sassertion}[name=associative,
17      type=axiom,
18      title=Associativity]
19      $\op!$ is associative
20    \end{sassertion}
21    \begin{sassertion}[name=isunit,
22      type=axiom,
23      title=Unit]
24      $\equal{\op{\svar{x}}{\unit}}{\svar{x}}$
25      for all $\inset{\svar{x}}{\universe}$
26    \end{sassertion}
27  \end{sparagraph}
28 \end{mathstructure}
29
30 An example for a \symname{monoid} is...
```

Output:

A **monoid** is a structure $\langle U, \circ, e \rangle$ where $\circ : U \rightarrow U$ and $e \in U$ such that

Axiom 5.1.2 (Associativity). \circ is associative

Axiom 5.1.3 (Unit). $x \circ e = x$ for all $x \in U$

An example for a **monoid** is...

Now the **mathstructure monoid** contains two additional symbols, namely the axioms for associativity and that e is a unit. Note that both symbols do not represent the mere *propositions* that e.g. \circ is associative, but *the assertion that it is actually true* that \circ is associative.

If we now want to instantiate **monoid** (unless with a variable, of course), we also need to assign **associative** and **neutral** to analogous assertions. So the earlier example

```
1 \instantiate{intmonoid}{  
2   universe = Int ,  
3   op = addition ,  
4   unit = zero  
5 }{monoid}{\mathbb{Z}_{+,0}}
```

...will not work anymore. We now need to give assertions that **addition** is associative and that **zero** is a unit with respect to addition.²

5.2 Proofs

TODO

²Of course, $\text{\texttt{S\TeX}}$ can not check that the assertions are the “correct” ones – but if the assertions (both in **monoid** as well as those for addition and zero) are properly marked up, MMT can. **TODO: should**

Chapter 6

Highlighting and Presentation Customizations

The environments starting with `s` (i.e. `smodule`, `sassertion`, `sexample`, `sdefinition`, `sparagraph` and `sproof`) by default produce no additional output whatsoever (except for the environment content of course). Instead, the document that uses them (whether directly or e.g. via `inputref`) can decide how these environments are supposed to look like.

The `stexthm` defines some default customizations that can be used, but of course many existing L^AT_EX templates come with their own `definition`, `theorem` and similar environments that authors are supposed (or even required) to use. Their concrete syntax however is usually not compatible with all the additional arguments that `gTEX` allows for semantic information.

Therefore we introduced the separate environments `sdefinition` etc. instead of using `definition` directly, and allow authors to specify how these environments should be styled via the commands `stexpatch*`.

```
\stexpatchmodule
\stexpatchdefinition
\stexpatchassertion
\stexpatchexample
\stexpatchparagraph
\stexpatchproof
```

All of these commands take one optional and two proper arguments, i.e.

```
\stexpatch*{<type>}{<begin-code>}{<end-code>}.
```

After `gTEX` reads and processes the optional arguments for these environments, (some of) their values are stored in the macros `\s*<field>` (i.e. `sexampleid`, `\sassertionname`, etc.). It then checks for all the values `<type>` in the `type=`-list, whether an `\stexpatch*{<type>}` for the current environment has been called. If it finds one, it uses that patches `<begin-code>` and `<end-code>` to mark up the current environment. If no patch for (any of) the type(s) is found, it checks whether and `\stexpatch*` was called without optional argument.

For example, if we want to use a predefined `theorem` environment for `sassertions` with `type=theorem`, we can do

```
1 \stexpatchassertion[theorem]{\begin{theorem}}{\end{theorem}}
```

...or, rather, since e.g. `theorem`-environments defined using `amsthm` take an optional title as argument, we can do:

```
1 \stexpatchassertion[theorem]
2   {\ifx\sassertiontitle\@empty
3     \begin{theorem}}
```

```

4   \else
5     \begin{theorem}[\sassertiontitle]
6   \fi}
7   {\end{theorem}}

```

Or, if we want all **sdefinitions** to use a predefined **definition**-environment, we can do

```

1 \stexpatchdefinition
2   {\ifx\sdefinitiontitle\@empty
3     \begin{definition}
4   \else
5     \begin{definition}[\sdefinitiontitle]
6   \fi}
7   {\end{definition}}

```

`\compemph`
`\varemp`
`\symrefemph`
`\defemph`

Apart from the environments, we can control how \TeX highlights variables, notation components, `\symrefs` and `\definiendums`, respectively.

To do so, we simply redefine these four macros. For example, to highlight notation components (i.e. everything in a `\comp`) in blue, as in this document, we can do `\def\compemph#1{\textcolor{blue}{#1}}`. By default, `\compemph` et al do nothing.

`\compemph@uri`
`\varemp@uri`
`\symrefemph@uri`
`\defemph@uri`

For each of the four macros, there exists an additional macro that takes the full URI of the relevant symbol currently being highlighted as a second argument. That allows us to e.g. use pdf tooltips and links. For example, this document uses

```

1 \protected\def\symrefemph@uri#1#2{
2   \pdftooltip{
3     \srefsymuri{#2}{\symrefemph{#1}}
4   }{
5     URI:~\detokenize{#2}
6   }
7 }

```

By default, `\compemph@uri` is simply defined as `\compemph{#1}` (analogously for the other three commands).

Documentation

Chapter 8

sTeX-Basics

This sub package provides general set up code, auxiliary methods and abstractions for xhtml annotations.

8.1 Macros and Environments

<code>\sTeX</code>	Both print this sTeX logo.
<code>\stex</code>	

<code>\stex_debug:nn</code>	<code>\stex_debug:nn {<log-prefix>} {<message>}</code>
-----------------------------	--

Logs *<message>*, if the package option `debug` contains *<log-prefix>*.

8.1.1 HTML Annotations

<code>\if@latexml</code>	L ^A T _E X2e conditional for L ^A T _E XML
--------------------------	---

<code>\latexml_if_p: *</code>	L ^A T _E X3 conditionals for L ^A T _E XML.
<code>\latexml_if:TF *</code>	

<code>\stex_if_do_html_p: *</code>	Whether to currently produce any HTML annotations (can be false in some advanced structuring environments, for example)
<code>\stex_if_do_html:TF *</code>	

<code>\stex_suppress_html:n</code>	Temporarily disables HTML annotations in its argument code
------------------------------------	--

We have four macros for annotating generated HTML (via L^AT_EXML or R_US_TE_X) with attributes:

<code>\stex_annotate:nnn</code>	<code>\stex_annotate:nnn {⟨property⟩} {⟨resource⟩} {⟨content⟩}</code>
<code>\stex_annotate_invisible:nnn</code>	
<code>\stex_annotate_invisible:n</code>	

Annotates the HTML generated by `⟨content⟩` with

`property="stex:⟨property⟩", resource="⟨resource⟩".`

`\stex_annotate_invisible:n` adds the attributes

`stex:visible="false", style="display:none".`

`\stex_annotate_invisible:nnn` combines the functionality of both.

<code>stex_annotate_env</code>	<code>\begin{stex_annotate_env}{⟨property⟩}{⟨resource⟩}</code> <code>⟨content⟩</code> <code>\end{stex_annotate_env}</code> behaves like <code>\stex_annotate:nnn {⟨property⟩} {⟨resource⟩} {⟨content⟩}</code> .
--------------------------------	--

8.1.2 Babel Languages

<code>\c_stex_languages_prop</code>
<code>\c_stex_language_abbrevs_prop</code>

Map language abbreviations to their full babel names and vice versa. e.g. `\c_stex_languages_prop{en}` yields `english`, and `\c_stex_language_abbrevs_prop{english}` yields `en`.

8.1.3 Auxiliary Methods

<code>\stex_deactivate_macro:Nn</code>	<code>\stex_deactivate_macro:Nn⟨cs⟩{⟨environments⟩}</code>
<code>\stex_reactivate_macro:N</code>	

Makes the macro `⟨cs⟩` throw an error, indicating that it is only allowed in the context of `⟨environments⟩`.

`\stex_reactivate_macro:N⟨cs⟩` reactivates it again, i.e. this happens ideally in the `⟨begin⟩`-code of the associated environments.

<code>\ignorespacesandpars</code>	ignores white space characters and <code>\par</code> control sequences. Expands tokens in the process.
-----------------------------------	--

Chapter 9

STEX-MathHub

This sub package provides code for handling ST_EX archives, files, file paths and related methods.

9.1 Macros and Environments

<code>\stex_kpsewhich:n</code>	<code>\stex_kpsewhich:n</code> executes <code>kpsewhich</code> and stores the return in <code>\l_stex_kpsewhich_return_str</code> . This does not require shell escaping.
--------------------------------	---

9.1.1 Files, Paths, URIs

<code>\stex_path_from_string:Nn</code>	<code>\stex_path_from_string:Nn</code> $\langle path-variable \rangle$ $\{\langle string \rangle\}$ turns the $\langle string \rangle$ into a path by splitting it at <code>/</code> -characters and stores the result in $\langle path-variable \rangle$. Also applies <code>\stex_path_canonicalize:N</code> .
--	--

<code>\stex_path_to_string:NN</code> <code>\stex_path_to_string:N</code>	The inverse; turns a path into a string and stores it in the second argument variable, or leaves it in the input stream.
---	--

<code>\stex_path_canonicalize:N</code>	Canonicalizes the path provided; in particular, resolves <code>.</code> and <code>..</code> path segments.
--	--

<code>\stex_path_if_absolute_p:N</code> \star <code>\stex_path_if_absolute:N\underline{T}</code> \star	Checks whether the path provided is <i>absolute</i> , i.e. starts with an empty segment
--	---

<code>\c_stex_pwd_seq</code> <code>\c_stex_pwd_str</code> <code>\c_stex_mainfile_seq</code> <code>\c_stex_mainfile_str</code>	Store the current working directory as path-sequence and string, respectively, and the (heuristically guessed) full path to the main file, based on the PWD and <code>\jobname</code> .
--	---

<code>\g_stex_currentfile_seq</code>	The file being currently processed (respecting <code>\input</code> etc.)
--------------------------------------	--

<code>\stex_filestack_push:n</code>	Push and pop (repectively) a file path to the file stack, to keep track of the current file.
<code>\stex_filestack_pop:</code>	Are called in hooks <code>file/before</code> and <code>file/after</code> , respectively.

9.1.2 MathHub Archives

<code>\mathhub</code>	We determine the path to the local MathHub folder via one of three means, in order of precedence:
<code>\c_stex_mathhub_seq</code>	
<code>\c_stex_mathhub_str</code>	

1. The `mathhub` package option, or
2. the `\mathhub`-macro, if it has been defined before the `\usepackage{stex}`-statement, or
3. the `MATHHUB` system variable.

In all three cases, `\c_stex_mathhub_seq` and `\c_stex_mathhub_str` are set accordingly.

<code>\l_stex_current_repository_prop</code>
--

Always points to the *current* MathHub repository (if we currently are in one). Has the following fields corresponding to the entries in the `MANIFEST.MF`-file:

- `id`: The name of the archive, including its group (e.g. `smglom/calculus`),
- `ns`: The content namespace (for modules and symbols),
- `narr`: the narration namespace (for document references),
- `docurl`: The URL that is used as a basis for *external references*,
- `deps`: All archives that this archive depends on (currently not in use).

<code>\stex_set_current_repository:n</code>

Sets the current repository to the one with the provided ID. calls `__stex_mathhub_do_manifest:n`, so works whether this repository's `MANIFEST.MF`-file has already been read or not.

<code>\stex_require_repository:n</code>	Calls <code>__stex_mathhub_do_manifest:n</code> iff the corresponding archive property list does not already exist, and adds a corresponding definition to the <code>.sms</code> -file.
---	--

<code>\stex_in_repository:nn</code>	<code>\stex_in_repository:nn{<repository-name>}{<code>}</code>
-------------------------------------	--

Change the current repository to `{<repository-name>}` (or not, if `{<repository-name>}` is empty), and passes its ID on to `{<code>}` as `#1`. Switches back to the previous repository after executing `{<code>}`.

9.1.3 Using Content in Archives

<hr/> <hr/> <code>\mhpath *</code>	<code>\mhpath{<archive-ID>}{<filename>}</code> Expands to the full path of file <code><filename></code> in repository <code><archive-ID></code> . Does not check whether the file or the repository exist.
<hr/> <hr/> <code>\inputref</code> <code>\mhinput</code>	<code>\inputref[<archive-ID>]{<filename>}</code> Both <code>\input</code> the file <code><filename></code> in archive <code><archive-ID></code> (relative to the <code>source-</code> subdirectory). <code>\mhinput</code> does so directly. <code>\inputref</code> does so within an <code>\begingroup... \endgroup-</code> block, and skips it in <code>html-mode</code> , inserting a <i>reference</i> to the file instead. Both also set <code>\ifinputref</code> to true.
<hr/> <hr/> <code>\addmhbibresource</code>	<code>\inputref[<archive-ID>]{<filename>}</code> Adds a <code>.bib</code> -file <code><filename></code> in archive <code><archive-ID></code> (relative to the top-directory of the archive!).
<hr/> <hr/> <code>\libinput</code>	<code>\libinput{<filename>}</code> Inputs <code><filename>.tex</code> from the <code>lib</code> folders in the current archive and the <code>meta-inf-</code> archive of the current archive group(s) (if existent) in descending order. Throws an error if no file by that name exists in any of the relevant <code>lib</code> -folders.
<hr/> <hr/> <code>\libusepackage</code>	<code>\libusepackage[<args>]{<filename>}</code> Like <code>\libinput</code> , but looks for <code>.sty</code> -files and calls <code>\usepackage[<meta{args}>]{<Arg{filename}>}</code> instead of <code>\input</code> . Throws an error, if none or more than one suitable package file is found.
<hr/> <hr/> <code>\mhgraphics</code> <code>\cmhgraphics</code>	<i>If</i> the <code>graphicx</code> package is loaded, these macros are defined at <code>\begin{document}</code> . <code>\mhgraphics</code> takes the same arguments as <code>\includegraphics</code> , with the additional optional key <code>mhrefpos</code> . It then resolves the file path in <code>\mhgraphics[mhrefpos=Foo/Bar]{foo/bar.png}</code> relative to the <code>source-</code> folder of the <code>Foo/Bar</code> -archive. <code>\cmhgraphics</code> additional wraps the image in a <code>center</code> -environment.
<hr/> <hr/> <code>\lstinputmhlisting</code> <code>\clstinputmhlisting</code>	Like <code>\mhgraphics</code> , but only defined if the <code>listings</code> -package is loaded, and with <code>\lstinputlisting</code> instead of <code>\includegraphics</code> .

Chapter 10

STEX-References

This sub package contains code related to links and cross-references

10.1 Macros and Environments

\STEXreftitle

\STEXreftitle{<some title>}

Sets the title of the current document to *<some title>*. A reference to the current document from *some other* document will then be displayed accordingly. e.g. if **\STEXreftitle{foo book}** is called, then referencing Definition 3.5 in this document in another document will display **Definition 3.5 in foo book**.

\stex_get_document_uri:

Computes the current document uri from the current archive's **narr**-field and its location relative to the archive's **source**-directory. Reference targets are computed from this URI and the reference-id.

\l_stex_current_docns_str

Stores its result in **\l_stex_current_docns_str**

\stex_get_document_url:

Computes the current URL from the current archive's **docurl**-field and its location relative to the archive's **source**-directory. Reference targets are computed from this URL and the reference-id, if this document is only included in SMS mode.

\l_stex_current_docurl_str

Stores its result in **\l_stex_current_docurl_str**

10.1.1 Setting Reference Targets

\stex_ref_new_doc_target:n

\stex_ref_new_doc_target:n{<id>}

Sets a new reference target with id *<id>*.

\stex_ref_new_sym_target:n

\stex_ref_new_sym_target:n{<uri>}

Sets a new reference target for the symbol *<uri>*.

10.1.2 Using References

<hr/> <hr/>	<code>\sref[$\langle opt-args \rangle$]{$\langle id \rangle$}</code>
	References the label with if $\langle id \rangle$. Optional arguments: TODO
<hr/> <hr/>	<code>\srefsym[$\langle opt-args \rangle$]{$\langle symbol \rangle$}</code>
	Like <code>\sref</code> , but references the <i>canonical label</i> for the provided symbol. The canonical target is the last of the following occurring in the document: <ul style="list-style-type: none">• A <code>\definiendum</code> or <code>\definame</code> for $\langle symbol \rangle$,• The <code>sassertion</code>, <code>sexample</code> or <code>sparagraph</code> with <code>for=$\langle symbol \rangle$</code> that generated $\langle symbol \rangle$ in the first place, or• A <code>\sparagraph</code> with <code>type=symdoc</code> and <code>for=$\langle symbol \rangle$</code>.
<hr/> <hr/>	<code>\srefsymuri{$\langle URI \rangle$}{$\langle text \rangle$}</code>
	A convenient short-hand for <code>\srefsym[linktext={$\langle text \rangle$}] {$\langle URI \rangle$}</code> , but requires the first argument to be a full URI already. Intended to be used in e.g. <code>\compemph@uri</code> , <code>\defemph@uri</code> , etc.

Chapter 11

STEX-Modules

This sub package contains code related to Modules

11.1 Macros and Environments

The content of a module with uri $\langle <URI> \rangle$ is stored in four macros. All modifications of these macros are global:

 $\backslash\text{c_stex_module_}\langle URI \rangle_prop$

A property list with the following fields:

name The *name* of the module,

ns the *namespace* in field **ns**,

file the *file* containing the module, as a sequence of path fragments

lang the module's *language*,

sig the language of the signature module, if the current file is a translation from some other language,

deprecate if this module is deprecated, the module that replaces it,

meta the metatheory of the module.

 $\backslash\text{c_stex_module_}\langle URI \rangle_code$

The code to execute when this module is activated (i.e. imported), e.g. to set all the semantic macros, notations, etc.

 $\backslash\text{c_stex_module_}\langle URI \rangle_constants$

The names of all constants declared in the module

 $\backslash\text{c_stex_module_}\langle URI \rangle_constants$

The full URIs of all modules imported in this module

<hr/> <hr/> <code>\l_stex_current_module_str</code>	<code>\l_stex_current_module_str</code> always contains the URI of the current module (if existent).
<hr/> <hr/> <code>\l_stex_all_modules_seq</code>	Stores full URIs for all modules currently in scope.
<hr/> <hr/> <code>\stex_if_in_module_p: *</code> <code>\stex_if_in_module:TF *</code>	Conditional for whether we are currently in a module
<hr/> <hr/> <code>\stex_if_module_exists_p:n *</code> <code>\stex_if_module_exists:nTF *</code>	Conditional for whether a module with the provided URI is already known.
<hr/> <hr/> <code>\stex_add_to_current_module:n</code> <code>\STEXexport</code>	Adds the provided tokens to the <code>_code</code> control sequence of the current module. <code>\stex_add_to_current_module:n</code> is used internally, <code>\STEXexport</code> is intended for users and additionally executes the provided code immediately.
<hr/> <hr/> <code>\stex_add_constant_to_current_module:n</code>	Adds the declaration with the provided name to the <code>_constants</code> control sequence of the current module.
<hr/> <hr/> <code>\stex_add_import_to_current_module:n</code>	Adds the module with the provided full URI to the <code>_imports</code> control sequence of the current module.
<hr/> <hr/> <code>\stex_collect_imports:n</code>	Iterates over all imports of the provided (full URI of a) module and stores them as a topologically sorted list – including the provided module as the last element – in <code>\l_stex_collect_imports_seq</code>
<hr/> <hr/> <code>\stex_do_up_to_module:n</code>	Code that is <i>exported</i> from module (such as symbol declarations) should be local <i>to the current module</i> . For that reason, ideally all symbol declarations and similar commands should be called directly in the module environment, however, that is not always feasible, e.g. in structural features or <code>sparapraphs</code> . <code>\stex_do_up_to_module</code> therefore executes the provided code repeatedly in an <code>\aftergroup</code> up until the group level is equal to that of the innermost smodule environment.

`\stex_modules_current_namespace:`

Computes the current namespace as follows:

If the current file is `.../source/sub/file.tex` in some archive with namespace `http://some.namespace/foo`, then the namespace of is `http://some.namespace/foo/sub/file`. Otherwise, the namespace is the absolute file path of the current file (i.e. starting with `file:///`).

The result is stored in `\l_stex_module_ns_str`. Additionally, the sub path relative to the current repository is stored in `\l_stex_module_subpath_str`.

11.1.1 The `smodule` environment

`module` `\begin{module}[\langle options \rangle]{\langle name \rangle}`

Opens a new module with name `\langle name \rangle`. Options are:

`title` (`\langle token list \rangle`) to display in customizations.

`type` (`\langle string \rangle*`) for use in customizations.

`deprecate` (`\langle module \rangle`) if set, will throw a warning when loaded, urging to use `\langle module \rangle` instead.

`id` (`\langle string \rangle`) for cross-referencing.

`ns` (`\langle URI \rangle`) the namespace to use. *Should not be used, unless you know precisely what you're doing.* If not explicitly set, is computed using `\stex_modules_current_namespace:`.

`lang` (`\langle language \rangle`) if not set, computed from the current file name (e.g. `foo.en.tex`).

`sig` (`\langle language \rangle`) if the current file is a translation of a file with the same base name but a different language suffix, setting `sig=<lang>` will preload the module from that language file. This helps ensuring that the (formal) content of both modules is (almost) identical across languages and avoids duplication.

`creators` (`\langle string \rangle*`) names of the creators.

`contributors` (`\langle string \rangle*`) names of contributors.

`srccite` (`\langle string \rangle`) a source citation for the content of this module.

`\stex_module_setup:nn` `\stex_module_setup:nn{\langle params \rangle}{\langle name \rangle}`

Sets up a new module with name `\langle name \rangle` and optional parameters `\langle params \rangle`. In particular, sets `\l_stex_current_module_str` appropriately.

`\stexpatchmodule` `\stexpatchmodule [\langle type \rangle] {\langle begincode \rangle} {\langle endcode \rangle}`

Customizes the presentation for those `smodule`-environments with `type=\langle type \rangle`, or all others if no `\langle type \rangle` is given.

`\STEXModule` `\STEXModule {\langle fragment \rangle}`

Attempts to find a module whose URI ends with `\langle fragment \rangle` in the current scope and passes the full URI on to `\stex_invoke_module:n`.

`\stex_invoke_module:n` Invoked by `\STEXModule`. Needs to be followed either by `!\macro` or `?{\langle symbolname \rangle}`. In the first case, it stores the full URI in `\macro`; in the second case, it invokes the symbol `\langle symbolname \rangle` in the selected module.

`\stex_activate_module:n`

Activate the module with the provided URI; i.e. executes all macro code of the module's `_code`-macro (does nothing if the module is already activated in the current context) and adds the module to `\l_stex_all_modules_seq`.

Chapter 12

STEX-Module Inheritance

Code related to Module Inheritance, in particular *sms mode*.

12.1 Macros and Environments

12.1.1 SMS Mode

“SMS Mode” is used when loading modules from external tex files. It deactivates any output and ignores all T_EX commands not explicitly allowed via the following lists – all of which either declare module content or are needed in order to declare module content:

`\g_stex_smsmode_allowedmacros_tl`

Macros that are executed as is; i.e. sms mode continues immediately after. These macros may not take any arguments or otherwise gobble tokens.

Initially: `\makeatletter`, `\makeatother`, `\ExplSyntaxOn`, `\ExplSyntaxOff`.

`\g_stex_smsmode_allowedmacros_escape_tl`

Macros that are executed and potentially gobble up further tokens. These macros need to make sure, that the very last token they ultimately expand to is `\stex_smsmode_do:`.

Initially: `\symdecl`, `\notation`, `\symdef`, `\importmodule`, `\STEXexport`, `\inlineass`, `\inlinedef`, `\inlineex`, `\endinput`, `\setnotation`, `\copynotation`.

`\g_stex_smsmode_allowedenvs_seq`

The names of environments that should be allowed in SMS mode. The corresponding `\begin`-statements are treated like the macros in `\g_stex_smsmode_allowedmacros_escape_tl`, so `\stex_smsmode_do:` needs to be the last token in the `\begin`-code. Since `\end`-statements take no arguments anyway, those are called directly and sms mode continues afterwards.

Initially: `smodule`, `copymodule`, `interpretmodule`, `sdefinition`, `sexample`, `sassertion`, `sparagraph`.

`\stex_if_smsmode_p: *`
`\stex_if_smsmode: TF *`

Tests whether SMS mode is currently active.

<hr/> <hr/> <code>\stex_file_in_smsmode:nn</code>	<code>\stex_in_smsmode:nn</code> $\{\langle filename \rangle\}$ $\{\langle code \rangle\}$
	Executes $\langle code \rangle$ in SMS mode, followed by the content of $\langle filename \rangle$. $\langle code \rangle$ can be used e.g. to set the current repository, and is executed within a new tex group, and the same group as the file content.

<hr/> <hr/> <code>\stex_smsmode_do:</code>	Starts gobbling tokens until one is encountered that is allowed in SMS mode.
--	--

12.1.2 Imports and Inheritance

<hr/> <hr/> <code>\importmodule</code>	<code>\importmodule</code> $[\langle archive-ID \rangle]$ $\{\langle module-path \rangle\}$
	Imports a module by reading it from a file and “activating” it. $\text{\texttt{S\TeX}}$ determines the module and its containing file by passing its arguments on to <code>\stex_import_module_path:nn</code> .

<hr/> <hr/> <code>\usemodule</code>	<code>\importmodule</code> $[\langle archive-ID \rangle]$ $\{\langle module-path \rangle\}$
	Like <code>\importmodule</code> , but does not export its contents; i.e. including the current module will not activate the used module

`\stex_import_module_uri:nn`

`\stex_import_module_uri:nn` $\{\langle archive-ID \rangle\}$ $\{\langle module-path \rangle\}$

Determines the URI of a module by splitting $\langle module-path \rangle$ into $\langle path \rangle?\langle name \rangle$. If $\langle module-path \rangle$ does *not* contain a ?-character, we consider it to be the $\langle name \rangle$, and $\langle path \rangle$ to be empty.

If $\langle archive-ID \rangle$ is empty, it is automatically set to the ID of the current archive (if one exists).

1. If $\langle archive-ID \rangle$ is empty:

- (a) If $\langle path \rangle$ is empty, then $\langle name \rangle$ must have been declared earlier in the same file and retrievable from `\g_stex_modules_in_file_seq`, or a file with name $\langle name \rangle.\langle lang \rangle.tex$ must exist in the same folder, containing a module $\langle name \rangle$.

That module should have the same namespace as the current one.

- (b) If $\langle path \rangle$ is not empty, it must point to the relative path of the containing file as well as the namespace.

2. Otherwise:

- (a) If $\langle path \rangle$ is empty, then $\langle name \rangle$ must have been declared earlier in the same file and retrievable from `\g_stex_modules_in_file_seq`, or a file with name $\langle name \rangle.\langle lang \rangle.tex$ must exist in the top `source` folder of the archive, containing a module $\langle name \rangle$.

That module should lie directly in the namespace of the archive.

- (b) If $\langle path \rangle$ is not empty, it must point to the path of the containing file as well as the namespace, relative to the namespace of the archive.

If a module by that namespace exists, it is returned. Otherwise, we call `\stex_require_module:nn` on the `source` directory of the archive to find the file.

`\l_stex_import_name_str`
`\l_stex_import_archive_str`
`\l_stex_import_path_str`
`\l_stex_import_ns_str`

stores the result in these four variables.

`\stex_import_require_module:nnnn` $\{\langle ns \rangle\}$ $\{\langle archive-ID \rangle\}$ $\{\langle path \rangle\}$ $\{\langle name \rangle\}$

Checks whether a module with URI $\langle ns \rangle?\langle name \rangle$ already exists. If not, it looks for a plausible file that declares a module with that URI.

Finally, activates that module by executing its `_code`-macro.

Chapter 13

STEX-Symbols

Code related to symbol declarations and notations

13.1 Macros and Environments

$\backslash\text{symdecl}$	$\backslash\text{symdecl}\{\langle\text{macroname}\rangle\}[\langle\text{args}\rangle]$
----------------------------	---

Declares a new symbol with semantic macro $\backslash\text{macroname}$. Optional arguments are:

- **name**: An (OMDOC) name. By default equal to $\langle\text{macroname}\rangle$.
- **type**: An (ideally semantic) term, representing a *type*. Not used by STEX, but passed on to MMT for semantic services.
- **def**: An (ideally semantic) term, representing a *definiens*. Not used by STEX, but passed on to MMT for semantic services.
- **local**: A boolean (by default false). If set, this declaration will not be added to the module content, i.e. importing the current module will not make this declaration available.
- **args**: Specifies the “signature” of the semantic macro. Can be either an integer $0 \leq n \leq 9$, or a (more precise) sequence of the following characters:
 - i** a “normal” argument, e.g. $\backslash\text{symdecl}\{\text{plus}\}[\text{args}=\text{ii}]$ allows for $\backslash\text{plus}\{2\}\{2\}$.
 - a** an *associative* argument; i.e. a sequence of arbitrarily many arguments provided as a comma-separated list, e.g. $\backslash\text{symdecl}\{\text{plus}\}[\text{args}=\text{a}]$ allows for $\backslash\text{plus}\{2,2,2\}$.
 - b** a *variable* argument. Is treated by STEX like an *i*-argument, but an application is turned into an **OMBind** in OMDOC, binding the provided variable in the subsequent arguments of the operator; e.g. $\backslash\text{symdecl}\{\text{forall}\}[\text{args}=\text{bi}]$ allows for $\backslash\text{forall}\{x\in\text{Nat}\}\{x\geq 0\}$.

<hr/> <hr/> <code>\stex_symdecl_do:n</code>	<p>Implements the core functionality of <code>\symdecl</code>, and is called by <code>\symdecl</code> and <code>\symdef</code>. Ultimately stores the symbol $\langle URI \rangle$ in the property list <code>\l_stex_symdecl_<URI>_prop</code> with fields:</p> <ul style="list-style-type: none"> • <code>name</code> (string), • <code>module</code> (string), • <code>notations</code> (sequence of strings; initially empty), • <code>local</code> (boolean), • <code>type</code> (token list), • <code>args</code> (string of <code>is</code>, <code>as</code> and <code>bs</code>), • <code>arity</code> (integer string), • <code>assoc</code> (integer string; number of associative arguments),
<hr/> <hr/> <code>\stex_all_symbols:n</code>	Iterates over all currently available symbols. Requires two <code>\seq_map_break:</code> to break fully.
<hr/> <hr/> <code>\stex_get_symbol:n</code>	Computes the full URI of a symbol from a macro argument, e.g. the macro name, the macro itself, the full URI...
<hr/> <hr/> <code>\notation</code>	<p><code>\notation[<args>]{<symbol>}{<notations⁺>}</code> Introduces a new notation for $\langle symbol \rangle$, see <code>\stex_notation_do:nn</code></p>
<hr/> <hr/> <code>\stex_notation_do:nn</code>	<p><code>\stex_notation_do:nn{<URI>}{<notations⁺>}</code> Implements the core functionality of <code>\notation</code>, and is called by <code>\notation</code> and <code>\symdef</code>. Ultimately stores the notation in the property list <code>\g_stex_notation_<URI>#<variant>#<lang>_prop</code> with fields:</p> <ul style="list-style-type: none"> • <code>symbol</code> (URI string), • <code>language</code> (string), • <code>variant</code> (string), • <code>opprec</code> (integer string), • <code>argprec</code> (sequence of integer strings)
<hr/> <hr/> <code>\symdef</code>	<p><code>\symdef[<args>]{<symbol>}{<notations⁺>}</code> Combines <code>\symdecl</code> and <code>\notation</code> by introducing a new symbol and assigning a new notation for it.</p>

Chapter 14

STEX-Terms

Code related to symbolic expressions, typesetting notations, notation components, etc.

14.1 Macros and Environments

<hr/> <hr/> <code>\STEXsymbol</code>	Uses <code>\stex_get_symbol:n</code> to find the symbol denoted by the first argument and passes the result on to <code>\stex_invoke_symbol:n</code>
<hr/> <hr/> <code>\symref</code>	<code>\symref{<symbol>}{<text>}</code> shortcut for <code>\STEXsymbol{<symbol>}! [<text>]</code>
<hr/> <hr/> <code>\stex_invoke_symbol:n</code>	Executes a semantic macro. Outside of math mode or if followed by <code>*</code> , it continues to <code>\stex_term_custom:nn</code> . In math mode, it uses the default or optionally provided notation of the associated symbol. If followed by <code>!</code> , it will invoke the symbol <i>itself</i> rather than its application (and continue to <code>\stex_term_custom:nn</code>), i.e. it allows to refer to <code>\plus!</code> [addition] as an operation, rather than <code>\plus[addition of]{some}{terms}</code> .
<hr/> <hr/> <code>_stex_term_math_oms:nnnn</code> <code>_stex_term_math_oma:nnnn</code> <code>_stex_term_math_omb:nnnn</code>	<code><URI><fragment><precedence><body></code> Annotates <code><body></code> as an OMDOC-term (OMID, OMA or OMBIND, respectively) with head symbol <code><URI></code> , generated by the specific notation <code><fragment></code> with (upwards) operator precedence <code><precedence></code> . Inserts parentheses according to the current downwards precedence and operator precedence.
<hr/> <hr/> <code>_stex_term_math_arg:nnn</code>	<code>\stex_term_arg:nnn<int><prec><body></code> Annotates <code><body></code> as the <code><int></code> th argument of the current OMA or OMBIND, with (downwards) argument precedence <code><prec></code> .
<hr/> <hr/> <code>_stex_term_math_assoc_arg:nnnn</code>	<code>\stex_term_arg:nnn<int><prec><notation><body></code> Annotates <code><body></code> as the <code><int></code> th (associative) <i>sequence</i> argument (as comma-separated list of terms) of the current OMA or OMBIND, with (downwards) argument precedence <code><prec></code> and associative notation <code><notation></code> .

<hr/> <hr/>	
<code>\infprec</code> <code>\neginfprec</code>	Maximal and minimal notation precedences.
<hr/> <hr/>	
<code>\dobrackets</code>	<code>\dobrackets {⟨body⟩}</code>
	Puts $\langle body \rangle$ in parentheses; scaled if in display mode unscaled otherwise. Uses the current \SIX brackets (by default (and)), which can be changed temporarily using <code>\withbrackets</code> .
<hr/> <hr/>	
<code>\withbrackets</code>	<code>\withbrackets ⟨left⟩ ⟨right⟩ {⟨body⟩}</code>
	Temporarily (i.e. within $\langle body \rangle$) sets the brackets used by \SIX for automated bracketing (by default (and)) to $\langle left \rangle$ and $\langle right \rangle$. Note that $\langle left \rangle$ and $\langle right \rangle$ need to be allowed after <code>\left</code> and <code>\right</code> in display-mode.
<hr/> <hr/>	
<code>\stex_term_custom:nn</code>	<code>\stex_term_custom:nn{⟨URI⟩}{⟨args⟩}</code>
	Implements custom one-time notation. Invoked by <code>\stex_invoke_symbol:n</code> in text mode, or if followed by <code>*</code> in math mode, or whenever followed by <code>!</code> .
<hr/> <hr/>	
<code>\stex_highlight_term:nn</code>	<code>\stex_highlight_term:nn{⟨URI⟩}{⟨args⟩}</code>
	Establishes a context for <code>\comp</code> . Stores the URI in a variable so that <code>\comp</code> knows which symbol governs the current notation.
<hr/> <hr/>	
<code>\comp</code> <code>\compemph</code> <code>\compemph@uri</code> <code>\defemph</code> <code>\defemph@uri</code> <code>\symrefemph</code> <code>\symrefemph@uri</code> <code>\varemp</code> <code>\varemp@uri</code>	<code>\comp{⟨args⟩}</code> Marks $\langle args \rangle$ as a notation component of the current symbol for highlighting, linking, etc. The precise behavior is governed by <code>\@comp</code> , which takes as additional argument the URI of the current symbol. By default, <code>\@comp</code> adds the URI as a PDF tooltip and colors the highlighted part in blue. <code>\@defemph</code> behaves like <code>\@comp</code> , and can be similarly redefined, but marks an expression as <i>definiendum</i> (used by <code>\definiendum</code>)
<hr/> <hr/>	
<code>\STEXinvisible</code>	Exports its argument as OMDoc (invisible), but does not produce PDF output. Useful e.g. for semantic macros that take arguments that are not part of the symbolic notation.
<hr/> <hr/>	
<code>\ellipses</code>	TODO

sTeX-Proofs: Structural Markup for Proofs

The `sproof` package is part of the sTeX collection, a version of T_EX/L^AT_EX that allows to markup T_EX/L^AT_EX documents semantically without leaving the document format, essentially turning T_EX/L^AT_EX into a document format for mathematical knowledge management (MKM).

This package supplies macros and environment that allow to annotate the structure of mathematical proofs in sTeX files. This structure can be used by MKM systems for added-value services, either directly from the sTeX sources, or after translation.

Contents

17.1 Introduction

The `sproof` (semantic proofs) package supplies macros and environment that allow to annotate the structure of mathematical proofs in \LaTeX files. This structure can be used by MKM systems for added-value services, either directly from the \LaTeX sources, or after translation. Even though it is part of the \LaTeX collection, it can be used independently, like its sister package `statements`.

\LaTeX is a version of $\text{\TeX}/\text{\LaTeX}$ that allows to markup $\text{\TeX}/\text{\LaTeX}$ documents semantically without leaving the document format, essentially turning $\text{\TeX}/\text{\LaTeX}$ into a document format for mathematical knowledge management (MKM).

```
\begin{sproof}[id=simple-proof]
  {We prove that  $\sum_{i=1}^n (2i-1) = n^2$  by induction over  $n$ }
  \begin{spfcases}{For the induction we have to consider the following cases:}
    \begin{spfcase}{ $n=1$ }
      \begin{spfstep}[type=inline] then we compute  $1=1^2$ \end{spfstep}
    \end{spfcase}
    \begin{spfcase}{ $n=2$ }
      \begin{sproofcomment}[type=inline]
        This case is not really necessary, but we do it for the
        fun of it (and to get more intuition).
      \end{sproofcomment}
      \begin{spfstep}[type=inline] We compute  $1+3=2^2=4$ .\end{spfstep}
    \end{spfcase}
    \begin{spfcase}{ $n>1$ }
      \begin{spfstep}[type=assumption,id=ind-hyp]
        Now, we assume that the assertion is true for a certain  $k \geq 1$ ,
        i.e.  $\sum_{i=1}^k (2i-1) = k^2$ .
      \end{spfstep}
      \begin{sproofcomment}
        We have to show that we can derive the assertion for  $n=k+1$  from
        this assumption, i.e.  $\sum_{i=1}^{k+1} (2i-1) = (k+1)^2$ .
      \end{sproofcomment}
      \begin{spfstep}
        We obtain  $\sum_{i=1}^{k+1} (2i-1) = \sum_{i=1}^k (2i-1) + 2(k+1) - 1$ 
        \begin{justification}[method=arith:split-sum]
          by splitting the sum.
        \end{justification}
      \end{spfstep}
      \begin{spfstep}
        Thus we have  $\sum_{i=1}^{k+1} (2i-1) = k^2 + 2k + 1$ 
        \begin{justification}[method=fertilize]
          by inductive hypothesis.
        \end{justification}
      \end{spfstep}
      \begin{spfstep}[type=conclusion]
        We can \begin{justification}[method=simplify]simplify\end{justification}
        the right-hand side to  $(k+1)^2$ , which proves the assertion.
      \end{spfstep}
    \end{spfcase}
  \end{spfcases}
  \begin{spfstep}[type=conclusion]
    We have considered all the cases, so we have proven the assertion.
  \end{spfstep}
\end{sproof}
```

Example 1: A very explicit proof, marked up semantically

We will go over the general intuition by way of our running example (see Figure 1 for the source and Figure 2 for the formatted result).²

²EdNOTE: talk a bit more about proofs and their structure,... maybe copy from OMDoc spec.

17.2 The User Interface

17.2.1 Package Options

`showmeta` The `sproof` package takes a single option: `showmeta`. If this is set, then the metadata keys are shown (see [Kohlhase:metakeys] for details and customization options).

17.2.2 Proofs and Proof steps

`sproof` The `proof` environment is the main container for proofs. It takes an optional `KeyVal` argument that allows to specify the `id` (identifier) and `for` (for which assertion is this a proof) keys. The regular argument of the `proof` environment contains an introductory comment, that may be used to announce the proof style. The `proof` environment contains a sequence of `\step`, `proofcomment`, and `pfcases` environments that are used to markup the proof steps. The `proof` environment has a variant `Proof`, which does not use the proof end marker. This is convenient, if a proof ends in a case distinction, which brings it's own proof end marker with it. The `Proof` environment is a variant of `proof` that does not mark the end of a proof with a little box; presumably, since one of the subproofs already has one and then a box supplied by the outer proof would generate an otherwise empty line. The `\spfidea` macro allows to give a one-paragraph description of the proof idea.

`spfsketch` For one-line proof sketches, we use the `\spfsketch` macro, which takes the `KeyVal` argument as `sproof` and another one: a natural language text that sketches the proof.

`spfstep` Regular proof steps are marked up with the `step` environment, which takes an optional `KeyVal` argument for annotations. A proof step usually contains a local assertion (the text of the step) together with some kind of evidence that this can be derived from already established assertions.

Note that both `\premise` and `\justarg` can be used with an empty second argument to mark up premises and arguments that are not explicitly mentioned in the text.

17.2.3 Justifications

`justification` This evidence is marked up with the `justification` environment in the `sproof` package. This environment totally invisible to the formatted result; it wraps the text in the proof step that corresponds to the evidence. The environment takes an optional `KeyVal` argument, which can have the `method` key, whose value is the name of a proof method (this will only need to mean something to the application that consumes the semantic annotations). Furthermore, the justification can contain “premises” (specifications to assertions that were used justify the step) and “arguments” (other information taken into account by the proof method).

`\premise` The `\premise` macro allows to mark up part of the text as reference to an assertion that is used in the argumentation. In the example in Figure 1 we have used the `\premise` macro to identify the inductive hypothesis.

`\justarg` The `\justarg` macro is very similar to `\premise` with the difference that it is used to mark up arguments to the proof method. Therefore the content of the first argument is interpreted as a mathematical object rather than as an identifier as in the case of `\premise`. In our example, we specified that the simplification should take place on the right hand side of the equation. Other examples include proof methods that instantiate. Here we would indicate the substituted object in a `\justarg` macro.

Proof: We prove that $\sum_{i=1}^n 2i - 1 = n^2$ by induction over n

1. For the induction we have to consider the following cases:
 - 1.1. $n = 1$: then we compute $1 = 1^2$ □
 - 1.2. $n = 2$: This case is not really necessary, but we do it for the fun of it (and to get more intuition). We compute $1 + 3 = 2^2 = 4$ □
 - 1.3. $n > 1$:
 - 1.3.1. Now, we assume that the assertion is true for a certain $k \geq 1$, i.e. $\sum_{i=1}^k (2i - 1) = k^2$.
 - 1.3.2. We have to show that we can derive the assertion for $n = k + 1$ from this assumption, i.e. $\sum_{i=1}^{k+1} (2i - 1) = (k + 1)^2$.
 - 1.3.3. We obtain $\sum_{i=1}^{k+1} (2i - 1) = \sum_{i=1}^k (2i - 1) + 2(k + 1) - 1$ by splitting the sum
 - 1.3.4. Thus we have $\sum_{i=1}^{k+1} (2i - 1) = k^2 + 2k + 1$ by inductive hypothesis.
 - 1.3.5. We can simplify the right-hand side to $(k + 1)^2$, which proves the assertion. □
 - 1.4. We have considered all the cases, so we have proven the assertion. □

Example 2: The formatted result of the proof in Figure 1

17.2.4 Proof Structure

subproof	The <code>pfcases</code> environment is used to mark up a subproof. This environment takes an optional <code>KeyVal</code> argument for semantic annotations and a second argument that allows
method	to specify an introductory comment (just like in the <code>proof</code> environment). The <code>method</code> key can be used to give the name of the proof method executed to make this subproof.
spfcases	The <code>pfcases</code> environment is used to mark up a proof by cases. Technically it is a variant of the <code>subproof</code> where the <code>method</code> is <code>by-cases</code> . Its contents are <code>spfcase</code> environments that mark up the cases one by one.
spfcase	The content of a <code>pfcases</code> environment are a sequence of case proofs marked up in the <code>pfcase</code> environment, which takes an optional <code>KeyVal</code> argument for semantic annotations. The second argument is used to specify the the description of the case under consideration. The content of a <code>pfcase</code> environment is the same as that of a <code>proof</code> , i.e.
\spfcasesketch	<code>steps</code> , <code>proofcomments</code> , and <code>pfcases</code> environments. <code>\spfcasesketch</code> is a variant of the <code>spfcase</code> environment that takes the same arguments, but instead of the <code>spfsteps</code> in the body uses a third argument for a proof sketch.
sproofcomment	The <code>proofcomment</code> environment is much like a <code>step</code> , only that it does not have an object-level assertion of its own. Rather than asserting some fact that is relevant for the proof, it is used to explain where the proof is going, what we are attempting to to, or what we have achieved so far. As such, it cannot be the target of a <code>\premise</code> .

17.2.5 Proof End Markers

Traditionally, the end of a mathematical proof is marked with a little box at the end of the last line of the proof (if there is space and on the end of the next line if there isn't), like so:

\sproofend	The <code>sproof</code> package provides the <code>\sproofend</code> macro for this. If a different symbol for the proof end is to be used (e.g. <i>q.e.d</i>), then this can be obtained by specifying it using the
\sProofEndSymbol	<code>\sProofEndSymbol</code> configuration macro (e.g. by specifying <code>\sProofEndSymbol{q.e.d}</code>). Some of the proof structuring macros above will insert proof end symbols for subproofs, in most cases, this is desirable to make the proof structure explicit, but sometimes this wastes space (especially, if a proof ends in a case analysis which will supply its own proof end marker). To suppress it locally, just set <code>proofend={}</code> in them or use use <code>\sProofEndSymbol{}</code> .

17.2.6 Configuration of the Presentation

Finally, we provide configuration hooks in Figure 1 for the keywords in proofs. These are mainly intended for package authors building on `statements`, e.g. for multi-language support.³. The proof step labels can be customized via the `\pstlabelstyle` macro:

Environment	configuration macro	value
<code>sproof</code>	<code>\spf@proof@kw</code>	Proof
<code>sketchproof</code>	<code>\spf@sketchproof@kw</code>	Proof Sketch

Figure 1: Configuration Hooks for Semantic Proof Markup

\pstlabelstyle	<code>\pstlabelstyle{<style>}</code> sets the style; see Figure ?? for an overview of styles. Package writers can add additional styles by adding a macro <code>\pst@make@label@<style></code> that takes
----------------	---

³EdNOTE: we might want to develop an extension `sproof-babel` in the future.

two arguments: a comma-separated list of ordinals that make up the prefix and the current ordinal. Note that comma-separated lists can be conveniently iterated over by the \LaTeX `\@for...:=...\do{...}` macro; see Figure ?? for examples.

17.3 Limitations

In this section we document known limitations. If you want to help alleviate them, please feel free to contact the package author. Some of them are currently discussed in the \TeX issue tracker at [\[sTeX\]](#).

1. The numbering scheme of proofs cannot be changed. It is more geared for teaching proof structures (the author's main use case) and not for writing papers. reported by Tobias Pfeiffer (fixed)
2. currently proof steps are formatted by the \LaTeX `description` environment. We would like to configure this, e.g. to use the `inparaenum` environment for more condensed proofs. I am just not sure what the best user interface would be I can imagine redefining an internal environment `spf@proofstep@list` or adding a key `prooflistenv` to the `proof` environment that allows to specify the environment directly. Maybe we should do both.

Chapter 18

sTeX-Metatheory

The default meta theory for an sTeX module. Contains symbols so ubiquitous, that it is virtually impossible to describe any flexiformal content without them, or that are required to annotate even the most primitive symbols with meaningful (foundation-independent) “type”-annotations, or required for basic structuring principles (theorems, definitions).

Foundations should ideally instantiate these symbols with their formal counterparts, e.g. `isa` corresponds to a typing operation in typed setting, or the \in -operator in set-theoretic contexts; `bind` corresponds to a universal quantifier in (n th-order) logic, or a Π in dependent type theories.

Chapter 20

document-structure: Semantic Markup for Open Mathematical Documents in L^AT_EX

The `document-structure` package is part of the \S T E X collection, a version of T E X/L A T E X that allows to markup T E X/L A T E X documents semantically without leaving the document format, essentially turning T E X/L A T E X into a document format for mathematical knowledge management (MKM).

This package supplies an infrastructure for writing OMDOC documents in L A T E X . This includes a simple structure sharing mechanism for \S T E X that allows to move from a copy-and-paste document development model to a copy-and-reference model, which conserves space and simplifies document management. The augmented structure can be used by MKM systems for added-value services, either directly from the \S T E X sources, or after translation.

20.1 Introduction

\S T E X is a version of T E X/L A T E X that allows to markup T E X/L A T E X documents semantically without leaving the document format, essentially turning T E X/L A T E X into a document format for mathematical knowledge management (MKM). The package supports direct translation to the OMDOC format [Koh06]

The `document-structure` package supplies macros and environments that allow to label document fragments and to reference them later in the same document or in other documents. In essence, this enhances the document-as-trees model to documents-as-directed-acyclic-graphs (DAG) model. This structure can be used by MKM systems for added-value services, either directly from the \S T E X sources, or after translation. Currently, trans-document referencing provided by this package can only be used in the \S T E X collection.

DAG models of documents allow to replace the “Copy and Paste” in the source document with a label-and-reference model where document are shared in the document

source and the formatter does the copying during document formatting/presentation.⁴

20.2 The User Interface

The `document-structure` package generates two files: `document-structure.cls`, and `document-structure.sty`. The OMDoc class is a minimally changed variant of the standard `article` class that includes the functionality provided by `document-structure.sty`. The rest of the documentation pertains to the functionality introduced by `document-structure.sty`.

20.2.1 Package and Class Options

The `document-structure` class accept the following options:

<code>class=<name></code>	load <code><name>.cls</code> instead of <code>article.cls</code>
<code>topsect=<sect></code>	The top-level sectioning level; the default for <code><sect></code> is <code>section</code>
<code>showignores</code>	show the the contents of the <code>ignore</code> environment after all
<code>showmeta</code>	show the metadata; see <code>metakeys.sty</code>
<code>showmods</code>	show modules; see <code>modules.sty</code>
<code>extrefs</code>	allow external references; see <code>sref.sty</code>
<code>defindex</code>	index definienda; see <code>statements.sty</code>
<code>minimal</code>	for testing; do not load any \TeX packages

The `document-structure` package accepts the same except the first two.

20.2.2 Document Structure

<code>document</code>	The top-level <code>document</code> environment can be given key/value information by the
<code>\documentkeys</code>	<code>\documentkeys</code> macro in the preamble ³ . This can be used to give metadata about the
<code>id</code>	document. For the moment only the <code>id</code> key is used to give an identifier to the <code>omdoc</code>
<code>sfragment</code>	element resulting from the L ^A T _E XML transformation.
	The structure of the document is given by the <code>omgroup</code> environment just like in OM-
	DOC. In the L ^A T _E X route, the <code>omgroup</code> environment is flexibly mapped to sectioning com-
	mands, inducing the proper sectioning level from the nesting of <code>omgroup</code> environments.
	Correspondingly, the <code>omgroup</code> environment takes an optional key/value argument for
	metadata followed by a regular argument for the (section) title of the <code>omgroup</code> . The op-
<code>id</code>	tional metadata argument has the keys <code>id</code> for an identifier, <code>creators</code> and <code>contributors</code>
<code>creators</code>	for the Dublin Core metadata [DCM03]; see [Koh20a] for details of the format. The
<code>contributors</code>	<code>short</code> allows to give a short title for the generated section. If the title contains semantic
<code>short</code>	macros, they need to be protected by <code>\protect</code> , and we need to give the <code>loadmodules</code>
<code>loadmodules</code>	key it needs no value. For instance we would have

```

\begin{smodule}{foo}
\symdef{bar}{B^a_r}
...
\begin{sfragment}[id=sec.barderv,loadmodules]{Introducing $\protect\bar$ Derivation

```

⁴EdNOTE: integrate with latexml's XMRef in the Math mode.

³We cannot patch the document environment to accept an optional argument, since other packages we load already do; pity.

`blindfragment`

\TeX automatically computes the sectioning level, from the nesting of `omgroup` environments. But sometimes, we want to skip levels (e.g. to use a `subsection*` as an introduction for a chapter). Therefore the `document-structure` package provides a variant `blindomgroup` that does not produce markup, but increments the sectioning level and logically groups document parts that belong together, but where traditional document markup relies on convention rather than explicit markup. The `blindomgroup` environment is useful e.g. for creating frontmatter at the correct level. Example 3 shows a typical setup for the outer document structure of a book with parts and chapters. We use two levels of `blindomgroup`:

- The outer one groups the introductory parts of the book (which we assume to have a sectioning hierarchy topping at the part level). This `blindomgroup` makes sure that the introductory remarks become a “chapter” instead of a “part”.
- The inner one groups the frontmatter⁴ and makes the preface of the book a section-level construct. Note that here the `display=flow` on the `omgroup` environment prevents numbering as is traditional for prefaces.

```
\begin{document}
\begin{blindfragment}
\begin{blindfragment}
\begin{frontmatter}
\maketitle\newpage
\begin{sfragment}[display=flow]{Preface}
... <<preface>> ...
\end{sfragment}
\clearpage\setcounter{tocdepth}{4}\tableofcontents\clearpage
\end{frontmatter}
\end{blindfragment}
... <<introductory remarks>> ...
\end{blindfragment}
\begin{sfragment}{Introduction}
... <<intro>> ...
\end{sfragment}
... <<more chapters>> ...
\bibliographystyle{alpha}\bibliography{kwarc}
\end{document}
```

Example 3: A typical Document Structure of a Book

`\skipomgroup`

The `\skipomgroup` “skips an `omgroup`”, i.e. it just steps the respective sectioning counter. This macro is useful, when we want to keep two documents in sync structurally, so that section numbers match up: Any section that is left out in one becomes a `\skipomgroup`.

`\currentsectionlevel`
`\CurrentSectionLevel`

The `\currentsectionlevel` macro supplies the name of the current sectioning level, e.g. “chapter”, or “subsection”. `\CurrentSectionLevel` is the capitalized variant. They are useful to write something like “In this `\currentsectionlevel`, we will...” in an `omgroup` environment, where we do not know which sectioning level we will end up.

⁴We shied away from redefining the `frontmatter` to induce a `blindomgroup`, but this may be the “right” way to go in the future.

20.2.3 Ignoring Inputs

`ignore` The `ignore` environment can be used for hiding text parts from the document structure.
`showignores` The body of the environment is not PDF or DVI output unless the `showignores` option is given to the `document-structure` class or `package`. But in the generated OMDoc result, the body is marked up with a `ignore` element. This is useful in two situations. For

editing One may want to hide unfinished or obsolete parts of a document

narrative/content markup In \LaTeX we mark up narrative-structured documents. In the generated OMDoc documents we want to be able to cache content objects that are not directly visible. For instance in the `statements` package [Koh20d] we use the `\inlinedef` macro to mark up phrase-level definitions, which verbalize more formal definitions. The latter can be hidden by an `ignore` and referenced by the `verbalizes` key in `\inlinedef`.

`\prematurestop` For prematurely stopping the formatting of a document, \LaTeX provides the `\prematurestop` macro. It can be used everywhere in a document and ignores all input after that – backing out of the `omgroup` environment as needed. After that – and before the implicit `\end{document}` it calls the internal `\afterprematurestop`, which can be customized to do additional cleanup or e.g. print the bibliography.

`\afterprematurestop` `\prematurestop` is useful when one has a driver file, e.g. for a course taught multiple years and wants to generate course notes up to the current point in the lecture. Instead of commenting out the remaining parts, one can just move the `\prematurestop` macro. This is especially useful, if we need the rest of the file for processing, e.g. to generate a theory graph of the whole course with the already-covered parts marked up as an overview over the progress; see `import_graph.py` from the `lmhtools` utilities [LMH].

20.2.4 Structure Sharing

`\STRlabel` The `\STRlabel` macro takes two arguments: a label and the content and stores the content for later use by `\STRcopy[⟨URL⟩]{⟨label⟩}`, which expands to the previously stored content. If the `\STRlabel` macro was in a different file, then we can give a URL `⟨URL⟩` that lets \LaTeX ML generate the correct reference.

`\STRsemantics` The `\STRlabel` macro has a variant `\STRsemantics`, where the label argument is optional, and which takes a third argument, which is ignored in \LaTeX . This allows to specify the meaning of the content (whatever that may mean) in cases, where the source document is not formatted for presentation, but is transformed into some content markup format.⁵

20.2.5 Global Variables

Text fragments and modules can be made more re-usable by the use of global variables. For instance, the admin section of a course can be made course-independent (and therefore re-usable) by using variables (actually token registers) `courseAcronym` and `courseTitle` instead of the text itself. The variables can then be set in the \LaTeX preamble of the course notes file. `\setSGvar{⟨vname⟩}{⟨text⟩}` to set the global variable `⟨vname⟩` to `⟨text⟩` and `\useSGvar{⟨vname⟩}` to reference it.

`\setSGvar`
`\useSGvar`
`\ifSGvar`

With `\ifSGvar` we can test for the contents of a global variable: the macro call

⁵EdNOTE: document LMID und LMXRef here if we decide to keep them.

`\ifSGvar{⟨vname⟩}{⟨val⟩}{⟨ctext⟩}` tests the content of the global variable `⟨vname⟩`, only if (after expansion) it is equal to `⟨val⟩`, the conditional text `⟨ctext⟩` is formatted.

20.2.6 Colors

For convenience, the `document-structure` package defines a couple of color macros for the `color` package: For instance `\blue` abbreviates `\textcolor{blue}`, so that `\blue{⟨something⟩}` writes `⟨something⟩` in blue. The macros `\red`, `\green`, `\cyan`, `\magenta`, `\brown`, `\yellow`, `\orange`, `\gray`, and finally `\black` are analogous.

20.3 Limitations

In this section we document known limitations. If you want to help alleviate them, please feel free to contact the package author. Some of them are currently discussed in the `TeX` GitHub repository [\[sTeX\]](#).

1. when option `book` which uses `\pagestyle{headings}` is given and semantic macros are given in the `omgroup` titles, then they sometimes are not defined by the time the heading is formatted. Need to look into how the headings are made.

Chapter 21

NotesSlides – Slides and Course Notes

We present a document class from which we can generate both course slides and course notes in a transparent way.

21.1 Introduction

The `notesslides` document class is derived from `beamer.cls` [Tana], it adds a “notes version” for course notes derived from the `omdoc` class [Kohlhase:smomdl] that is more suited to printing than the one supplied by `beamer.cls`.

21.2 The User Interface

The `notesslides` class takes the notion of a slide frame from Till Tantau’s excellent `beamer` class and adapts its notion of frames for use in the \LaTeX and OMDoc. To support semantic course notes, it extends the notion of mixing frames and explanatory text, but rather than treating the frames as images (or integrating their contents into the flowing text), the `notesslides` package displays the slides as such in the course notes to give students a visual anchor into the slide presentation in the course (and to distinguish the different writing styles in slides and course notes).

In practice we want to generate two documents from the same source: the slides for presentation in the lecture and the course notes as a narrative document for home study. To achieve this, the `notesslides` class has two modes: *slides mode* and *notes mode* which are determined by the package option.

21.2.1 Package Options

The `notesslides` class takes a variety of class options:⁶

- | | |
|---|--|
| <code>slides</code>
<code>notes</code> | <ul style="list-style-type: none">• The options <code>slides</code> and <code>notes</code> switch between slides mode and notes mode (see Section 21.2.2). |
|---|--|

<code>sectocframes</code>	<ul style="list-style-type: none"> If the option <code>sectocframes</code> is given, then for the <code>omgroups</code>, special frames with the <code>omgroup</code> title (and number) are generated.
<code>showmeta</code>	<ul style="list-style-type: none"> <code>showmeta</code>. If this is set, then the metadata keys are shown (see [Koh20b] for details and customization options).
<code>frameimages</code> <code>fiboxed</code>	<ul style="list-style-type: none"> If the option <code>frameimages</code> is set, then slide mode also shows the <code>\frameimage</code>-generated frames (see section 21.2.4). If also the <code>fiboxed</code> option is given, the slides are surrounded by a box.
<code>topsect</code>	<ul style="list-style-type: none"> <code>topsect=<sect></code> can be used to specify the top-level sectioning level; the default for <code><sect></code> is <code>section</code>.

21.2.2 Notes and Slides

`frame` Slides are represented with the `frame` just like in the `beamer` class, see [Tanb] for details.
`note` The `notesslides` class adds the `note` environment for encapsulating the course note fragments.⁵

 Note that it is essential to start and end the `notes` environment at the start of the line – in particular, there may not be leading blanks – else L^AT_EX becomes confused and throws error messages that are difficult to decipher.

```
\ifnotes\maketitle\else
\frame[noframenumbering]\maketitle\fi

\begin{note}
  We start this course with ...
\end{note}

\begin{frame}
  \frametitle{The first slide}
  ...
\end{frame}
\begin{note}
  ... and more explanatory text
\end{note}

\begin{frame}
  \frametitle{The second slide}
  ...
\end{frame}
...
```

Example 4: A typical Course Notes File

By interleaving the `frame` and `note` environments, we can build course notes as shown in Figure 4.

`\ifnotes` Note the use of the `\ifnotes` conditional, which allows different treatment between

⁶EDNOTE: leaving out `noproblems` for the moment until we decide what to do with it.

⁵MK: it would be very nice, if we did not need this environment, and this should be possible in principle, but not without intensive L^AT_EX trickery. Hints to the author are welcome.

`notes` and `slides` mode – manually setting `\notesttrue` or `\notesfalse` is strongly discouraged however.

⚠: We need to give the title frame the `noframenumbering` option so that the frame numbering is kept in sync between the slides and the course notes.

⚠: The `beamer` class recommends not to use the `allowframebreaks` option on frames (even though it is very convenient). This holds even more in the `notesslides` case: At least in conjunction with `\newpage`, frame numbering behaves funnily (we have tried to fix this, but who knows).

If we want to transclude a the contents of a file as a note, we can use a new variant `\inputref*` of the `\inputref` macro from [KGA20]: `\inputref*{foo}` is equivalent to `\begin{note}\inputref{foo}\end{note}`.

There are some environments that tend to occur at the top-level of `note` environments. We make convenience versions of these: e.g. the `nparagraph` environment is just an `sparagraph` inside a `note` environment (but looks nicer in the source, since it avoids one level of source indenting). Similarly, we have the `nomgroup`, `ndefinition`, `nexample`, `nsproof`, and `nassertion` environments.

`\inputref*`
`nparagraph`
`nfragment`
`ndefinition`
`nexample`
`nsproof`
`nassertion`

21.2.3 Header and Footer Lines of the Slides

The default logo provided by the `notesslides` package is the \TeX logo it can be customized using `\setslidelogo{<logo name>}`.

The default footer line of the `notesslides` package mentions copyright and licensing. In the `beamer` class, `\source` stores the author's name as the copyright holder . By default it is *Michael Kohlhase* in the `notesslides` package since he is the main user and designer of this package. `\setsource{<name>}` can change the writer's name. For licensing, we use the Creative Commons Attribution-ShareAlike license by default to strengthen the public domain. If package `hyperref` is loaded, then we can attach a hyperlink to the license logo. `\setlicensing[<url>]{<logo name>}` is used for customization, where `<url>` is optional.

`\setslidelogo`
`\setsource`
`\setlicensing`

21.2.4 Frame Images

Sometimes, we want to integrate slides as images after all – e.g. because we already have a PowerPoint presentation, to which we want to add \TeX notes. In this case we can use `\frameimage[<opt>]{<path>}`, where `<opt>` are the options of `\includegraphics` from the `graphicx` package [CR99] and `<path>` is the file path (extension can be left off like in `\includegraphics`). We have added the `label` key that allows to give a frame label that can be referenced like a regular `beamer` frame.⁷

`\frameimage`
`\mhframeimage`

The `\mhframeimage` macro is a variant of `\frameimage` with repository support. Instead of writing

```
\frameimage{\MathHub{fooMH/bar/source/baz/foobar}}
```

we can simply write (assuming that `\MathHub` is defined as above)

```
\mhframeimage[fooMH/bar]{baz/foobar}
```

⁷EdNOTE: MK: the `hyperref` link does not seem to work yet. I wonder why but do not have the time to fix it.

Note that the `\mhframeimage` form is more semantic, which allows more advanced document management features in MathHub.

If `baz/foobar` is the “current module”, i.e. if we are on the MathHub path `...MathHub/fooMH/bar...`, then stating the repository in the first optional argument is redundant, so we can just use

```
\mhframeimage{baz/foobar}
```

21.2.5 Colors and Highlighting

`\textwarning` The `\textwarning` macro generates a warning sign: 

21.2.6 Front Matter, Titles, etc.

21.2.7 Excursions

In course notes, we sometimes want to point to an “excursion” – material that is either presupposed or tangential to the course at the moment – e.g. in an appendix. The typical setup is the following:

```
\excursion{founif}{../ex/founif}{We will cover first-order unification in}
...
\begin{appendix}\printexcursions\end{appendix}
```

```
\excursion      The \excursion{<ref>}{<path>}{<text>} is syntactic sugar for
\activateexcursion
\begin{nparagraph}[title=Excursion]
  \activateexcursion{founif}{../ex/founif}
  We will cover first-order unification in \sref{founif}.
\end{nparagraph}
```

```
\activateexcursion      where \activateexcursion{<path>} augments the \printexcursions macro by a
\printexcursions        call \inputref{<path>}. In this way, the3 \printexcursions macro (usually in the
                        appendix) will collect up all excursions that are specified in the main text.
```

Sometimes, we want to reference – in an excursion – part of another. We can use

```
\excursionref \excursionref{<label>} for that.
```

Finally, we usually want to put the excursions into an `omgroup` environment and add an introduction, therefore we provide the a variant of the `\printexcursions` macro:

```
\excursiongroup \excursiongroup[id=<id>,intro=<path>] is equivalent to
```

```
\begin{note}
\begin{sfragment}[id=<id>]{Excursions}
  \inputref{<path>}
  \printexcursions
\end{sfragment}
\end{note}
```

21.2.8 Miscellaneous

21.3 Limitations

In this section we document known limitations. If you want to help alleviate them, please feel free to contact the package author. Some of them are currently discussed in the \TeX GitHub repository [[sTeX](#)].

1. when option `book` which uses `\pagestyle{headings}` is given and semantic macros are given in the `omgroup` titles, then they sometimes are not defined by the time the heading is formatted. Need to look into how the headings are made. This is a problem of the underlying `omdoc` package.

Chapter 22

problem.sty: An Infrastructure for formatting Problems

The `problem` package supplies an infrastructure that allows specify problems and to reuse them efficiently in multiple environments.

22.1 Introduction

The `problem` package supplies an infrastructure that allows specify problem. Problems are text fragments that come with auxiliary functions: hints, notes, and solutions⁶. Furthermore, we can specify how long the solution to a given problem is estimated to take and how many points will be awarded for a perfect solution.

Finally, the `problem` package facilitates the management of problems in small files, so that problems can be re-used in multiple environment.

22.2 The User Interface

22.2.1 Package Options

<code>solutions</code>	The <code>problem</code> package takes the options <code>solutions</code> (should solutions be output?), <code>notes</code>
<code>notes</code>	(should the problem notes be presented?), <code>hints</code> (do we give the hints?), <code>gnotes</code> (do we
<code>hints</code>	show grading notes?), <code>pts</code> (do we display the points awarded for solving the problem?),
<code>gnotes</code>	<code>min</code> (do we display the estimated minutes for problem soling). If theses are specified, then
<code>pts</code>	the corresponding auxiliary parts of the problems are output, otherwise, they remain
<code>min</code>	invisible.
<code>boxed</code>	The <code>boxed</code> option specifies that problems should be formatted in framed boxes so
<code>test</code>	that they are more visible in the text. Finally, the <code>test</code> option signifies that we are in
	a test situation, so this option does not show the solutions (of course), but leaves space
	for the students to solve them.
<code>mh</code>	The <code>mh</code> option turns on MathHub support; see [<code>Kohlhase:mss</code>].
<code>showmeta</code>	Finally, if the <code>showmeta</code> is set, then the metadata keys are shown (see [<code>Kohlhase:metakeys</code>]
	for details and customization options).

⁶for the moment multiple choice problems are not supported, but may well be in a future version

22.2.2 Problems and Solutions

problem The main environment provided by the **problem** package is (surprise surprise) the **problem** environment. It is used to mark up problems and exercises. The environment takes an optional KeyVal argument with the keys **id** as an identifier that can be reference later, **pts** for the points to be gained from this exercise in homework or quiz situations, **min** for the estimated minutes needed to solve the problem, and finally **title** for an informative title of the problem. For an example of a marked up problem see Figure 5 and the resulting markup see Figure 6.

```
\usepackage[solutions,hints,pts,min]{problem}
\begin{document}
  \begin{sproblem}[id=elephants,pts=10,min=2,title=Fitting Elephants]
    How many Elephants can you fit into a Volkswagen beetle?
  \begin{hint}
    Think positively, this is simple!
  \end{hint}
  \begin{exnote}
    Justify your answer
  \end{exnote}
  \begin{solution}[for=elephants,height=3cm]
    Four, two in the front seats, and two in the back.
  \begin{gnote}
    if they do not give the justification deduct 5 pts
  \end{gnote}
  \end{solution}
  \end{sproblem}
\end{document}
```

Example 5: A marked up Problem

solution The **solution** environment can be to specify a solution to a problem. If the **solutions** option is set or **\solutionstrue** is set in the text, then the solution will be presented in the output. The **solution** environment takes an optional KeyVal argument with the keys **id** for an identifier that can be reference **for** to specify which problem this is a solution for, and **height** that allows to specify the amount of space to be left in test situations (i.e. if the **test** option is set in the **\usepackage** statement).

```
Problem 0.1 (Fitting Elephants)
How many Elephants can you fit into a Volkswagen beetle?

---

Hint: Think positively, this is simple!

---

Note:Justify your answer

---

Solution: Four, two in the front seats, and two in the back.

---

```

Example 6: The Formatted Problem from Figure 5

hint The **hint** and **exnote** environments can be used in a **problem** environment to give hints and to make notes that elaborate certain aspects of the problem.

exnote

gnote The **gnote** (grading notes) environment can be used to document situations that

may arise in grading.

Sometimes we would like to locally override the `solutions` option we have given to the package. To turn on solutions we use the `\startsolutions`, to turn them off, `\stopsolutions`. These two can be used at any point in the documents.

Also, sometimes, we want content (e.g. in an exam with master solutions) conditional on whether solutions are shown. This can be done with the `\ifsolutions` conditional.

22.2.3 Multiple Choice Blocks

Multiple choice blocks can be formatted using the `mcb` environment, in which single choices are marked up with `\mcc[⟨keyvals⟩]{⟨text⟩}` macro, which takes an optional key/value argument `⟨keyvals⟩` for choice metadata and a required argument `⟨text⟩` for the proposed answer text. The following keys are supported

- `T` • `T` for true answers, `F` for false ones,
- `F` • `Ttext` the verdict for true answers, `Ftext` for false ones, and
- `Ttext` • `feedback` for a short feedback text given to the student.
- `Ftext`
- `feedback`

See Figure ?? for an example

22.2.4 Including Problems

The `\includeproblem` macro can be used to include a problem from another file. It takes an optional `KeyVal` argument and a second argument which is a path to the file containing the problem (the macro assumes that there is only one problem in the include file). The keys `title`, `min`, and `pts` specify the problem title, the estimated minutes for solving the problem and the points to be gained, and their values (if given) overwrite the ones specified in the `problem` environment in the included file.

22.2.5 Reporting Metadata

The sum of the points and estimated minutes (that we specified in the `pts` and `min` keys to the `problem` environment or the `\includeproblem` macro) to the log file and the screen after each run. This is useful in preparing exams, where we want to make sure that the students can indeed solve the problems in an allotted time period.

The `\min` and `\pts` macros allow to specify (i.e. to print to the margin) the distribution of time and reward to parts of a problem, if the `pts` and `pts` package options are set. This allows to give students hints about the estimated time and the points to be awarded.

22.3 Limitations

In this section we document known limitations. If you want to help alleviate them, please feel free to contact the package author. Some of them are currently discussed in the [sTeXGitHub repository](#) [[sTeX](#)].

1. none reported yet

```

\begin{sproblem}[title=Functions]
  What is the keyword to introduce a function definition in python?
  \begin{mcb}
    \mcc[T]{def}
    \mcc[F,feedback=that is for C and C++){function}
    \mcc[F,feedback=that is for Standard ML]{fun}
    \mcc[F,Ftext=Noooooooooooo,feedback=that is for Java]{public static void}
  \end{mcb}
\end{sproblem}

```

Problem 0.2 (Functions)

What is the keyword to introduce a function definition in python?

1. def
2. function
3. fun
4. public static void

Problem 0.3 (Functions)

What is the keyword to introduce a function definition in python?

1. def
!
2. function
that is for C and C++
3. fun
that is for Standard ML
4. public static void
that is for Java

Chapter 23

`hwexam.sty/cls`: An Infrastructure for formatting Assignments and Exams

The `hwexam` package and class allows individual course assignment sheets and compound assignment documents using problem files marked up with the `problem` package.

Contents

23.1 Introduction

The `hwexam` package and class supplies an infrastructure that allows to format nice-looking assignment sheets by simply including problems from problem files marked up with the `problem` package [Kohlhase:problem]. It is designed to be compatible with `problems.sty`, and inherits some of the functionality.

23.2 The User Interface

23.2.1 Package and Class Options

The `hwexam` package and class take the options `solutions`, `notes`, `hints`, `gnotes`, `pts`, `min`, and `boxed` that are just passed on to the `problems` package (cf. its documentation for a description of the intended behavior).

`showmeta` If the `showmeta` option is set, then the metadata keys are shown (see [Kohlhase:metakeys] for details and customization options).

The `hwexam` class additionally accepts the options `report`, `book`, `chapter`, `part`, and `showignores`, of the `omdoc` package [Kohlhase:smomdl] on which it is based and passes them on to that. For the `extrefs` option see [Kohlhase:sref].

23.2.2 Assignments

`assignment` This package supplies the `assignment` environment that groups problems into assignment sheets. It takes an optional KeyVal argument with the keys `number` (for the assignment number; if none is given, 1 is assumed as the default or — in multi-assignment documents — the ordinal of the `assignment` environment), `title` (for the assignment title; this is referenced in the title of the assignment sheet), `type` (for the assignment type; e.g. “quiz”, or “homework”), `given` (for the date the assignment was given), and `due` (for the date the assignment is due).

23.2.3 Typesetting Exams

`multiple` Furthermore, the `hwexam` package takes the option `multiple` that allows to combine multiple assignment sheets into a compound document (the assignment sheets are treated as section, there is a table of contents, etc.).

`test` Finally, there is the option `test` that modifies the behavior to facilitate formatting tests. Only in `test` mode, the macros `\testspace`, `\testnewpage`, and `\testemptypage` have an effect: they generate space for the students to solve the given problems. Thus they can be left in the L^AT_EX source.

`\testspace` `\testspace` takes an argument that expands to a dimension, and leaves vertical space accordingly. `\testnewpage` makes a new page in `test` mode, and `\testemptypage` generates an empty page with the cautionary message that this page was intentionally left empty.

`testheading` Finally, the `\testheading` takes an optional keyword argument where the keys `duration` specifies a string that specifies the duration of the test, `min` specifies the equivalent in number of minutes, and `reqpts` the points that are required for a perfect grade.

23.2.4 Including Assignments

`\inputassignment` The `\inputassignment` macro can be used to input an assignment from another file. It takes an optional `KeyVal` argument and a second argument which is a path to the file containing the problem (the macro assumes that there is only one `assignment` environment in the included file). The keys `number`, `title`, `type`, `given`, and `due` are just as for the `assignment` environment and (if given) overwrite the ones specified in the `assignment` environment in the included file.

23.3 Limitations

In this section we document known limitations. If you want to help alleviate them, please feel free to contact the package author. Some of them are currently discussed in the `STEX`GitHub repository [[sTeX](#)].

1. none reported yet.

Part IV

Implementation

Chapter 24

\TeX -Basics Implementation

24.1 The \TeX Document Class

The `stex` document class is pretty straight-forward: It largely extends the `standalone` package and loads the `stex` package, passing all provided options on to the package.

```
1 <*cls>
2
3 %%%%%%%%% basics.dtx %%%%%%%%%
4
5 \RequirePackage{expl3,l3keys2e,rustex}
6 \ProvidesExplClass{stex}{2022/03/03}{3.1.0}{sTeX document class}
7 \rustex_if:TF {
8   \LoadClass{article}
9 }{
10   \LoadClass[border=1px,varwidth]{standalone}
11   \setlength\textwidth{15cm}
12 }
13
14 \DeclareOption*{\PassOptionsToPackage{\CurrentOption}{stex}}
15 \ProcessOptions
16
17 \RequirePackage{stex}
18 </cls>
```

24.2 Preliminaries

```
19 <*package>
20
21 %%%%%%%%% basics.dtx %%%%%%%%%
22
23 \RequirePackage{expl3,l3keys2e,ltxcmds}
24 \ProvidesExplPackage{stex}{2022/03/03}{3.1.0}{sTeX package}
25
26 %\RequirePackage{morewrites}
```

```

27 %\RequirePackage{amsmath}
28
    Package options:
29 \keys_define:nn { stex } {
30   debug      .clist_set:N = \c_stex_debug_clist ,
31   lang       .clist_set:N = \c_stex_languages_clist ,
32   mathhub    .tl_set_x:N = \mathhub ,
33   sms        .bool_set:N = \c_stex_persist_mode_bool ,
34   image      .bool_set:N = \c_tikzinput_image_bool ,
35   unknown    .code:n      = {}
36 }
37 \ProcessKeysOptions { stex }

\stex The  $\TeX$  logo:
\TeX
38 \protected\def\stex{
39   \texorpdfstring{\raisebox{-.5ex}{S}\kern-.5ex\TeX}{sTeX}\xspace%
40 }
41 \let\TeX\stex

```

(End definition for `\stex` and `\sTeX`. These functions are documented on page 46.)

24.3 Messages and logging

```

42 <@@=stex_log>

    Warnings and error messages
43 \msg_new:nnn{stex}{error/unknownlanguage}{
44   Unknown~language:~#1
45 }
46 \msg_new:nnn{stex}{warning/nomathhub}{
47   MATHHUB~system~variable~not~found~and~no~
48   \detokenize{\mathhub}~value~set!
49 }
50 \msg_new:nnn{stex}{error/deactivated-macro}{
51   The~\detokenize{#1}~command~is~only~allowed~in~#2!
52 }

\stex_debug:nn A simple macro issuing package messages with subpath.
53 \cs_new_protected:Nn \stex_debug:nn {
54   \clist_if_in:NnTF \c_stex_debug_clist { all } {
55     \msg_set:nnn{stex}{debug / #1}{
56       \\Debug~#1:~#2\\
57     }
58     \msg_none:nn{stex}{debug / #1}
59   }{
60     \clist_if_in:NnT \c_stex_debug_clist { #1 } {
61       \msg_set:nnn{stex}{debug / #1}{
62         \\Debug~#1:~#2\\
63       }
64       \msg_none:nn{stex}{debug / #1}
65     }
66   }
67 }

```

(End definition for `\stex_debug:nn`. This function is documented on page 46.)

Redirecting messages:

```

68 \clist_if_in:NnTF \c_stex_debug_clist {all} {
69   \msg_redirect_module:nnn{ stex }{ none }{ term }
70 }{
71   \clist_map_inline:Nn \c_stex_debug_clist {
72     \msg_redirect_name:nnn{ stex }{ debug / ##1 }{ term }
73   }
74 }
75
76 \stex_debug:nn{log}{debug~mode~on}

```

24.4 HTML Annotations

```

77 <@=stex_annotate>
78 \RequirePackage{rustex}

```

We add the namespace abbreviation `ns:stex="http://kwarc.info/ns/sTeX"` to `RUSTEX`:

```

79 \rustex_add_Namespace:nn{stex}{http://kwarc.info/ns/sTeX}
80 \rustex_add_Namespace:nn{mmt}{http://uniformal.github.io/MMT}

```

Conditionals for `LATXML`:

`\if@latexml`

```

81 \ifcsname if@latexml\endcsname\else
82   \expandafter\newif\csname if@latexml\endcsname\@latexmlfalse
83 \fi

```

(End definition for `\if@latexml`. This function is documented on page 46.)

`\latexml_if_p:`

`\latexml_if:TF`

```

84 \prg_new_conditional:Nnn \latexml_if: {p, T, F, TF} {
85   \if@latexml
86     \expandafter\prg_return_true:
87   \else:
88     \expandafter\prg_return_false:
89   \fi:
90 }

```

(End definition for `\latexml_if:TF`. This function is documented on page 46.)

`\l__stex_annotate_arg_tl`
`\c__stex_annotate_emptyarg_tl`

Used by annotation macros to ensure that the HTML output to annotate is not empty.

```

91 \tl_new:N \l__stex_annotate_arg_tl
92 \tl_const:Nx \c__stex_annotate_emptyarg_tl {
93   \rustex_if:TF {
94     \rustex_direct_HTML:n { \c_ampersand_str \c_hash_str 8205; }
95   }{-}
96 }

```

(End definition for `\l__stex_annotate_arg_tl` and `\c__stex_annotate_emptyarg_tl`.)

`_stex_annotate_checkempty:n`

```

97 \cs_new_protected:Nn \_stex_annotate_checkempty:n {
98   \tl_set:Nn \l__stex_annotate_arg_tl { #1 }
99   \tl_if_empty:NT \l__stex_annotate_arg_tl {
100     \tl_set_eq:NN \l__stex_annotate_arg_tl \c__stex_annotate_emptyarg_tl
101   }
102 }

```

(End definition for `_stex_annotate_checkempty:n`.)

`\stex_if_do_html_p:`

Whether to (locally) produce HTML output

`\stex_if_do_html:TF`

```

103 \bool_new:N \_stex_html_do_output_bool
104 \bool_set_true:N \_stex_html_do_output_bool
105
106 \prg_new_conditional:Nnn \stex_if_do_html: {p,T,F,TF} {
107   \bool_if:nTF \_stex_html_do_output_bool
108     \prg_return_true: \prg_return_false:
109 }

```

(End definition for `\stex_if_do_html:TF`. This function is documented on page 46.)

`\stex_suppress_html:n`

Whether to (locally) produce HTML output

```

110 \cs_new_protected:Nn \stex_suppress_html:n {
111   \exp_args:Nne \use:nn {
112     \bool_set_false:N \_stex_html_do_output_bool
113     #1
114   }{
115     \stex_if_do_html:T {
116       \bool_set_true:N \_stex_html_do_output_bool
117     }
118   }
119 }

```

(End definition for `\stex_suppress_html:n`. This function is documented on page 46.)

`\stex_annotate:nnx`

We define four macros for introducing attributes in the HTML output. The definitions depend on the “backend” used (L^AT_EX_ML, R_US_TE_X, p_DF_LA_TE_X).

`\stex_annotate_invisible:n`

The p_DF_LA_TE_X-macros largely do nothing; the R_US_TE_X-implementations are pretty clear in what they do, the L^AT_EX_ML-implementations resort to perl bindings.

`\stex_annotate_invisible:nnn`

```

120 \rustex_if:TF{
121   \cs_new_protected:Nn \stex_annotate:nnn {
122     \_stex_annotate_checkempty:n { #3 }
123     \rustex_annotate_HTML:nn {
124       property="stex:#1" ~
125       resource="#2"
126     } {
127       \mode_if_vertical:TF{
128         \tl_use:N \l__stex_annotate_arg_tl\par
129       }{
130         \tl_use:N \l__stex_annotate_arg_tl
131       }
132     }
133   }
134   \cs_new_protected:Nn \stex_annotate_invisible:n {

```

```

135 \__stex_annotate_checkempty:n { #1 }
136 \rustex_annotate_HTML:nn {
137   stex:visible="false" ~
138   style:display="none"
139 } {
140   \mode_if_vertical:TF{
141     \tl_use:N \l__stex_annotate_arg_tl\par
142   }{
143     \tl_use:N \l__stex_annotate_arg_tl
144   }
145 }
146 }
147 \cs_new_protected:Nn \stex_annotate_invisible:nnn {
148   \__stex_annotate_checkempty:n { #3 }
149   \rustex_annotate_HTML:nn {
150     property="stex:#1" ~
151     resource="#2" ~
152     stex:visible="false" ~
153     style:display="none"
154   } {
155     \mode_if_vertical:TF{
156       \tl_use:N \l__stex_annotate_arg_tl\par
157     }{
158       \tl_use:N \l__stex_annotate_arg_tl
159     }
160   }
161 }
162 \NewDocumentEnvironment{stex_annotate_env} { m m } {
163   \par
164   \rustex_annotate_HTML_begin:n {
165     property="stex:#1" ~
166     resource="#2"
167   }
168 }{
169   \par\rustex_annotate_HTML_end:
170 }
171 }{
172   \latexml_if:TF {
173     \cs_new_protected:Nn \stex_annotate:nnn {
174       \__stex_annotate_checkempty:n { #3 }
175       \mode_if_math:TF {
176         \cs:w latexml@annotate@math\cs_end:{#1}{#2}{
177           \tl_use:N \l__stex_annotate_arg_tl
178         }
179       }{
180         \cs:w latexml@annotate@text\cs_end:{#1}{#2}{
181           \tl_use:N \l__stex_annotate_arg_tl
182         }
183       }
184     }
185     \cs_new_protected:Nn \stex_annotate_invisible:n {
186       \__stex_annotate_checkempty:n { #1 }
187       \mode_if_math:TF {
188         \cs:w latexml@invisible@math\cs_end:{

```

```

189         \tl_use:N \l__stex_annotate_arg_tl
190     }
191 } {
192     \cs:w latexml@invisible@text\cs_end:{
193         \tl_use:N \l__stex_annotate_arg_tl
194     }
195 }
196 }
197 \cs_new_protected:Nn \stex_annotate_invisible:nnn {
198     \__stex_annotate_checkempty:n { #3 }
199     \cs:w latexml@annotate@invisible\cs_end:{#1}{#2}{
200         \tl_use:N \l__stex_annotate_arg_tl
201     }
202 }
203 \NewDocumentEnvironment{stex_annotate_env} { m m } {
204     \par\begin{latexml@annotateenv}{#1}{#2}
205 }{
206     \par\end{latexml@annotateenv}
207 }
208 }{
209     \cs_new_protected:Nn \stex_annotate:nnn {#3}
210     \cs_new_protected:Nn \stex_annotate_invisible:n {}
211     \cs_new_protected:Nn \stex_annotate_invisible:nnn {}
212     \NewDocumentEnvironment{stex_annotate_env} { m m } {}{}
213 }
214 }

```

(End definition for `\stex_annotate:nnn`, `\stex_annotate_invisible:n`, and `\stex_annotate_invisible:nnn`.
These functions are documented on page 47.)

24.5 Babel Languages

```

215 <@@=stex_language>

```

`\c_stex_languages_prop` We store language abbreviations in two (mutually inverse) property lists:
`\c_stex_language_abbrevs_prop`

```

216 \prop_const_from_keyval:Nn \c_stex_languages_prop {
217     en = english ,
218     de = ngerman ,
219     ar = arabic ,
220     bg = bulgarian ,
221     ru = russian ,
222     fi = finnish ,
223     ro = romanian ,
224     tr = turkish ,
225     fr = french
226 }
227
228 \prop_const_from_keyval:Nn \c_stex_language_abbrevs_prop {
229     english = en ,
230     ngerman = de ,
231     arabic = ar ,
232     bulgarian = bg ,
233     russian = ru ,
234     finnish = fi ,

```

```

235   romanian = ro ,
236   turkish  = tr ,
237   french   = fr
238 }
239 % todo: chinese simplified (zhs)
240 %       chinese traditional (zht)

```

(End definition for `\c_stex_languages_prop` and `\c_stex_language_abbrevs_prop`. These variables are documented on page 47.)

we use the `lang`-package option to load the corresponding babel languages:

```

241 \clist_if_empty:NF \c_stex_languages_clist {
242   \clist_clear:N \l_tmpa_clist
243   \clist_map_inline:Nn \c_stex_languages_clist {
244     \prop_get:NnNTF \c_stex_languages_prop { #1 } \l_tmpa_str {
245       \clist_put_right:No \l_tmpa_clist \l_tmpa_str
246     } {
247       \msg_error:nnx{stex}{error/unknownlanguage}{\l_tmpa_str}
248     }
249   }
250   \stex_debug:nn{lang} {Languages:~\clist_use:Nn \l_tmpa_clist {,~} }
251   \RequirePackage[\clist_use:Nn \l_tmpa_clist,]{babel}
252 }
253 \AtBeginDocument{
254   \bool_lazy_any:nT {
255     {\rustex_if_p:}
256     {\latexml_if_p:}
257   } {
258     \seq_get_right:NN \g_stex_currentfile_seq \l_tmpa_str
259     \seq_set_split:NnV \l_tmpa_seq . \l_tmpa_str
260     \seq_pop_right:NN \l_tmpa_seq \l_tmpa_str % .tex
261     \seq_pop_left:NN \l_tmpa_seq \l_tmpa_str % <filename>
262     \seq_if_empty:NF \l_tmpa_seq { %remaining element should be language
263       \seq_pop_right:NN \l_tmpa_seq \l_tmpa_str
264       \stex_debug:nn{basics} {Language~\l_tmpa_str~
265         inferred~from~file~name}
266       \stex_annotate_invisible:nnn{language}{ \l_tmpa_str }{}
267     }
268   }
269 }
270 }

```

24.6 Auxiliary Methods

`\stex_deactivate_macro:Nn`

```

271 \cs_new_protected:Nn \stex_deactivate_macro:Nn {
272   \exp_after:wN\let\csname \detokenize{#1} - orig\endcsname#1
273   \def#1{

```

25.1 Generic Path Handling

We treat paths as L^AT_EX3-sequences (of the individual path segments, i.e. separated by a /-character) unix-style; i.e. a path is absolute if the sequence starts with an empty entry.

`\stex_path_from_string:Nn`

```
343 \cs_new_protected:Nn \stex_path_from_string:Nn {
344   \str_set:Nx \l_tmpa_str { #2 }
345   \str_if_empty:NTF \l_tmpa_str {
346     \seq_clear:N #1
347   }{
348     \exp_args:NNNo \seq_set_split:Nnn #1 / { \l_tmpa_str }
349     \sys_if_platform_windows:T{
350       \seq_clear:N \l_tmpa_tl
```

```

351 \seq_map_inline:Nn #1 {
352   \seq_set_split:Nnn \l_tmpb_tl \c_backslash_str { ##1 }

430 }

```

(End definition for `\stex_kpsewhich:n`. This function is documented on page 48.)

We determine the PWD

`\c_stex_pwd_seq`
`\c_stex_pwd_str`

```

431 \sys_if_platform_windows:TF{
432   \begingroup\escapechar=-1\catcode'\=12
433   \exp_args:Nx\stex_kpsewhich:n{-expand-var~\c_percent_str CD\c_percent_str}
434   \exp_args:NNx\str_replace_all:Nnn\l_stex_kpsewhich_return_str{\c_backslash_str}/
435   \exp_args:Nnx\use:nn{\endgroup}{\str_set:Nn\exp_not:N\l_stex_kpsewhich_return_str{\l_stex_
436   }}{
437   \stex_kpsewhich:n{-var-value~PWD}
438   }
439
440 \stex_path_from_string:Nn\c_stex_pwd_seq\l_stex_kpsewhich_return_str
441 \stex_path_to_string:NN\c_stex_pwd_seq\c_stex_pwd_str
442 \stex_debug:nn {mathhub} {PWD:~\str_use:N\c_stex_pwd_str}

```

(End definition for `\c_stex_pwd_seq` and `\c_stex_pwd_str`. These variables are documented on page 48.)

25.3 File Hooks and Tracking

```

443 <@@=stex_files>

```

We introduce hooks for file inputs that keep track of the absolute paths of files used. This will be useful to keep track of modules, their archives, namespaces etc.

Note that the absolute paths are only accurate in `\input`-statements for paths relative to the PWD, so they shouldn't be relied upon in any other setting than for \TeX -purposes.

`\g__stex_files_stack`

keeps track of file changes

```

444 \seq_gclear_new:N\g__stex_files_stack

```

(End definition for `\g__stex_files_stack`.)

`\c_stex_mainfile_seq`
`\c_stex_mainfile_str`

```

445 \str_set:Nx \c_stex_mainfile_str {\c_stex_pwd_str/\jobname.tex}
446 \stex_path_from_string:Nn \c_stex_mainfile_seq
447   \c_stex_mainfile_str

```

(End definition for `\c_stex_mainfile_seq` and `\c_stex_mainfile_str`. These variables are documented on page 48.)

`\g_stex_currentfile_seq`

```

448 \seq_gclear_new:N\g_stex_currentfile_seq

```

(End definition for `\g_stex_currentfile_seq`. This variable is documented on page 49.)

`\stex_filestack_push:n`

```

449 \cs_new_protected:Nn \stex_filestack_push:n {
450   \stex_path_from_string:Nn\g_stex_currentfile_seq{#1}
451   \stex_path_if_absolute:NF\g_stex_currentfile_seq{
452     \stex_path_from_string:Nn\g_stex_currentfile_seq{
453       \c_stex_pwd_str/#1
454     }
455   }
456   \seq_gset_eq:NN\g_stex_currentfile_seq\g_stex_currentfile_seq
457   \exp_args:NNo\seq_gpush:Nn\g__stex_files_stack\g_stex_currentfile_seq
458 }

```

(End definition for `\stex_filestack_push:n`. This function is documented on page 49.)

`\stex_filestack_pop:`

```

459 \cs_new_protected:Nn \stex_filestack_pop: {
460   \seq_if_empty:NF\g__stex_files_stack{
461     \seq_gpop:NN\g__stex_files_stack\l_tmpa_seq
462   }
463   \seq_if_empty:NTF\g__stex_files_stack{
464     \seq_gset_eq:NN\g_stex_currentfile_seq\c_stex_mainfile_seq
465   }{
466     \seq_get:NN\g__stex_files_stack\l_tmpa_seq
467     \seq_gset_eq:NN\g_stex_currentfile_seq\l_tmpa_seq
468   }
469 }
```

(End definition for `\stex_filestack_pop:`. This function is documented on page 49.)

Hooks for the current file:

```

470 \AddToHook{file/before}{
471   \stex_filestack_push:n{\CurrentFilePath/\CurrentFile}
472 }
473 \AddToHook{file/after}{
474   \stex_filestack_pop:
475 }
```

25.4 MathHub Repositories

476 `<@=stex_mathhub>`

`\mathhub` The path to the mathhub directory. If the `\mathhub`-macro is not set, we query `\c_stex_mathhub_seq` `\c_stex_mathhub_str` `kpsewhich` for the MATHHUB system variable.

```

477 \str_if_empty:NTF\mathhub{

```

(End definition for `\stex_modules_current_namespace::`. This function is documented on page 55.)

27.1 The smodule environment

smodule arguments:

```

1266 \keys_define:nn { stex / module } {
1267   title      .tl_set:N      = \smoduletitle ,
1268   type       .str_set_x:N    = \smoduletype ,
1269   id         .str_set_x:N    = \smoduleid ,
1270   deprecate  .str_set_x:N    = \l_stex_module_deprecate_str ,
1271   ns         .str_set_x:N    = \l_stex_module_ns_str ,
1272   lang       .str_set_x:N    = \l_stex_module_lang_str ,
1273   sig        .str_set_x:N    = \l_stex_module_sig_str ,
1274   creators   .str_set_x:N    = \l_stex_module_creators_str ,
1275   contributors .str_set_x:N  = \l_stex_module_contributors_str ,
1276   meta       .str_set_x:N    = \l_stex_module_meta_str ,
1277   srccite    .str_set_x:N    = \l_stex_module_srccite_str
1278 }
1279
1280 \cs_new_protected:Nn \__stex_modules_args:n {
1281   \str_clear:N \smoduletitle
1282   \str_clear:N \smoduletype
1283   \str_clear:N \smoduleid
1284   \str_clear:N \l_stex_module_ns_str
1285   \str_clear:N \l_stex_module_deprecate_str
1286   \str_clear:N \l_stex_module_lang_str
1287   \str_clear:N \l_stex_module_sig_str
1288   \str_clear:N \l_stex_module_creators_str
1289   \str_clear:N \l_stex_module_contributors_str
1290   \str_clear:N \l_stex_module_meta_str
1291   \str_clear:N \l_stex_module_srccite_str
1292   \keys_set:nn { stex / module } { #1 }
1293 }
1294
1295 % module parameters here? In the body?
1296

```

`\stex_module_setup:nn` Sets up a new module property list:

```

1297 \cs_new_protected:Nn \stex_module_setup:nn {
1298   \int_set:Nn \l__stex_modules_group_depth_int {\currentgrouplevel}
1299   \str_set:Nx \l_stex_module_name_str { #2 }
1300   \__stex_modules_args:n { #1 }

```

First, we set up the name and namespace of the module.

Are we in a nested module?

```

1301 \stex_if_in_module:TF {
1302   % Nested module
1303   \prop_get:cnN {c_stex_module\_l_stex_current_module_str _prop}

```

```

1304     { ns } \l_stex_module_ns_str
1305     \str_set:Nx \l_stex_module_name_str {
1306       \prop_item:cn {c_stex_module_\l_stex_current_module_str _prop}
1307       { name } / \l_stex_module_name_str
1308     }
1309   }{
1310     % not nested:
1311     \str_if_empty:NT \l_stex_module_ns_str {
1312       \stex_modules_current_namespace:
1313       \exp_args:NNNo \seq_set_split:Nnn \l_tmpa_seq
1314         / { \l_stex_module_ns_str }
1315       \seq_pop_right:NN \l_tmpa_seq \l_tmpa_str
1316       \str_if_eq:NNT \l_tmpa_str \l_stex_module_name_str {
1317         \str_set:Nx \l_stex_module_ns_str {
1318           \stex_path_to_string:N \l_tmpa_seq
1319         }
1320       }
1321     }
1322   }

```

Next, we determine the language of the module:

```

1323   \str_if_empty:NT \l_stex_module_lang_str {
1324     \seq_get_right:NN \g_stex_currentfile_seq \l_tmpa_str
1325     \seq_set_split:NnV \l_tmpa_seq . \l_tmpa_str
1326     \seq_pop_right:NN \l_tmpa_seq \l_tmpa_str % .tex
1327     \seq_pop_left:NN \l_tmpa_seq \l_tmpa_str % <filename>
1328     \seq_if_empty:NF \l_tmpa_seq { %remaining element should be [<something>.]language
1329       \seq_pop_right:NN \l_tmpa_seq \l_stex_module_lang_str
1330       \stex_debug:nn{modules} {Language~\l_stex_module_lang_str~
1331         inferred~from~file~name}
1332     }
1333   }
1334
1335   \stex_if_smsmode:F { \str_if_empty:NF \l_stex_module_lang_str {
1336     \prop_get:NVNTF \c_stex_languages_prop \l_stex_module_lang_str
1337     \l_tmpa_str {
1338       \ltx@ifpackageloaded{babel}{
1339         \exp_args:Nx \selectlanguage { \l_tmpa_str }
1340       }{}
1341     } {
1342       \msg_error:nnx{stex}{error/unknownlanguage}{\l_tmpa_str}
1343     }
1344   }}

```

We check if we need to extend a signature module, and set `\l_stex_current_module_prop` accordingly:

```

1345   \str_if_empty:NTF \l_stex_module_sig_str {
1346     \exp_args:Nnx \prop_gset_from_keyval:cn {
1347       c_stex_module_\l_stex_module_ns_str?\l_stex_module_name_str _prop
1348     } {
1349       name      = \l_stex_module_name_str ,
1350       ns        = \l_stex_module_ns_str ,
1351       file      = \exp_not:o { \g_stex_currentfile_seq } ,
1352       lang      = \l_stex_module_lang_str ,

```

```

1353     sig      = \l_stex_module_sig_str ,
1354     deprecate = \l_stex_module_deprecate_str ,
1355     meta     = \l_stex_module_meta_str
1356 }
1357 \seq_clear:c {c_stex_module_\l_stex_module_ns_str?\l_stex_module_name_str _imports}
1358 \seq_clear:c {c_stex_module_\l_stex_module_ns_str?\l_stex_module_name_str _constants}
1359 \seq_clear:c {c_stex_module_\l_stex_module_ns_str?\l_stex_module_name_str _copymodules}
1360 \tl_clear:c {c_stex_module_\l_stex_module_ns_str?\l_stex_module_name_str _code}
1361 \str_set:Nx\l_stex_current_module_str{\l_stex_module_ns_str?\l_stex_module_name_str}

```

We load the metatheory:

```

1362 \str_if_empty:NT \l_stex_module_meta_str {
1363   \str_set:Nx \l_stex_module_meta_str {
1364     \c_stex_metatheory_ns_str ? Metatheory
1365   }
1366 }

Chapter 33

The Implementation

33.1 Package Options

We declare some switches which will modify the behavior according to the package options. Generally, an option `xxx` will just set the appropriate switches to true (otherwise they stay false).⁸

```
5690 <*package>
5691 <@@=stex_sproof>
5692
5693 %%%%%%%%%%% sproof.dtx %%%%%%%%%%%
5694
```

33.2 Proofs

We first define some keys for the proof environment.

```
5695 \keys_define:nn { stex / spf } {
5696   id          .str_set_x:N = \spfid,
5697   for         .clist_set:N = \l__stex_sproof_spf_for_clist ,
5698   from        .tl_set:N    = \l__stex_sproof_spf_from_tl ,

`\c__stex_sproof_flow_str` We define this macro, so that we can test whether the `display` key has the value `flow`

```

5719 \str_set:Nn\c__stex_sproof_flow_str{inline}

```

(End definition for `\c__stex_sproof_flow_str`.)

For proofs, we will have to have deeply nested structures of enumerated list-like environments. However, L^AT_EX only allows `enumerate` environments up to nesting depth 4 and general list environments up to listing depth 6. This is not enough for us. Therefore we have decided to go along the route proposed by Leslie Lamport to use a single top-level list with dotted sequences of numbers to identify the position in the proof tree. Unfortunately, we could not use his `pf.sty` package directly, since it does not do automatic numbering, and we have to add keyword arguments all over the place, to accomodate semantic information.

`pst@with@label` This environment manages⁷ the path labeling of the proof steps in the description environment of the outermost `proof` environment. The argument is the label prefix up to now; which we cache in `\pst@label` (we need evaluate it first, since are in the right place now!). Then we increment the proof depth which is stored in `\count10` (lower counters are used by T_EX for page numbering) and initialize the next level counter `\count\count10` with 1. In the end call for this environment, we just decrease the proof depth counter by 1 again.

```

The next two environments (proof steps) and comments, are mostly semantical, they take `KeyVal` arguments that specify their semantic role. In draft mode, they read these values and show them. If the surrounding proof had `display=flow`, then no new `\item` is generated, otherwise it is. In any case, the proof step number (at the current level) is incremented.

6217 }

```

33.3 Justifications

We define the actions that are undertaken, when the keys for justifications are encountered. Here this is very simple, we just define an internal macro with the value, so that we can use it later.

```

6218 \keys_define:nn { stex / just }{
6219   id      .str_set:x:N = \l__stex_sproof_just_id_str,
6220   method  .tl_set:N    = \l__stex_sproof_just_method_tl,
6221   premises .tl_set:N    = \l__stex_sproof_just_premises_tl,
6222   args    .tl_set:N    = \l__stex_sproof_just_args_tl
6223 }

```

The next three environments and macros are purely semantic, so we ignore the keyval arguments for now and only display the content.¹¹

¹¹EDNOTE: need to do something about the premise in draft mode.

justification

```
6224 \newenvironment{justification}[1] [] {}{}
```

\premise

```
6225 \newcommand\stex_proof_promise:[2] [] {#2}
```

(End definition for \premise. This function is documented on page ??.)

\justarg the **\justarg** macro is purely semantic, so we ignore the keyval arguments for now and only display the content.

```
6226 \newcommand\justarg[2] [] {#2}
```

```
6227 \end{package}
```

(End definition for \justarg. This function is documented on page ??.)

Some auxiliary code, and clean up to be executed at the end of the package.

Chapter 37

document-structure.sty Implementation

37.1 The document-structure Class

The functionality is spread over the `document-structure` class and package. The class provides the `document` environment and the `document-structure` element corresponds to it, whereas the package provides the concrete functionality.

```
6419 \*cls)
6420 \@@=document_structure)
6421 \ProvidesExplClass{document-structure}{2022/02/26}{3.0.1}{Modular Document Structure Class}
6422 \RequirePackage{13keys2e}
```

37.2 Class Options

To initialize the `document-structure` class, we declare and process the necessary options using the `kvoptions` package for key/value options handling. For `omdoc.cls` this is quite simple. We have options `report` and `book`, which set the `\omdoc@cls@class` macro and pass on the macro to `omdoc.sty` for further processing.

`\omdoc@cls@class`

```
6423 \keys_define:nn{ document-structure / pkg }{
6424   class      .str_set_x:N = \c_document_structure_class_str,
6425   minimal    .bool_set:N = \c_document_structure_minimal_bool,
6426   report     .code:n      = {
6427     \ClassWarning{document-structure}{the option 'report' is deprecated, use 'class=report',
6428     \str_set:Nn \c_document_structure_class_str {report}
6429   },
6430   book       .code:n      = {
6431     \ClassWarning{document-structure}{the option 'book' is deprecated, use 'class=book', ins
6432     \str_set:Nn \c_document_structure_class_str {book}
6433   },
6434   bookpart   .code:n      = {
6435     \ClassWarning{document-structure}{the option 'bookpart' is deprecated, use 'class=book,t
6436     \str_set:Nn \c_document_structure_class_str {book}
6437     \str_set:Nn \c_document_structure_topsect_str {chapter}
6438   },
```

```

6439 docopt      .str_set_x:N = \c_document_structure_docopt_str,
6440 unknown     .code:n      = {
6441   \PassOptionsToPackage{ \CurrentOption }{ document-structure }
6442 }
6443 }
6444 \ProcessKeysOptions{ document-structure / pkg }
6445 \str_if_empty:NT \c_document_structure_class_str {
6446   \str_set:Nn \c_document_structure_class_str {article}
6447 }
6448 \exp_after:wN\LoadClass\exp_after:wN[\c_document_structure_docopt_str]
6449   {\c_document_structure_class_str}
6450

```

37.3 Beefing up the document environment

Now, – unless the option `minimal` is defined – we include the `stex` package

```

6451 \RequirePackage{document-structure}
6452 \bool_if:NF \c_document_structure_minimal_bool {

```

And define the environments we need. The top-level one is the `document` environment, which we redefined so that we can provide keyval arguments.

document For the moment we do not use them on the L^AT_EX level, but the document identifier is picked up by L^AT_EXML.¹²

```

6453 \keys_define:nn { document-structure / document }{
6454   id .str_set_x:N = \c_document_structure_document_id_str
6455 }
6456 \let\__document_structure_orig_document=\document
6457 \renewcommand{\document}[1][]{
6458   \keys_set:nn{ document-structure / document }{ #1 }
6459   \stex_ref_new_doc_target:n { \c_document_structure_document_id_str }
6460   \__document_structure_orig_document
6461 }

```

Finally, we end the test for the `minimal` option.

```

6462 }
6463 \</cls>

```

37.4 Implementation: document-structure Package

```

6464 \<*package>
6465 \ProvidesExplPackage{document-structure}{2022/02/26}{3.0.1}{Modular Document Structure}
6466 \RequirePackage{l3keys2e}

```

37.5 Package Options

We declare some switches which will modify the behavior according to the package options. Generally, an option `xxx` will just set the appropriate switches to true (otherwise they stay false).

¹²EDNOTE: faking documentkeys for now. @HANG, please implement

```

6467
6468 \keys_define:nn{ document-structure / pkg }{
6469   class      .str_set_x:N = \c_document_structure_class_str,
6470   topsect    .str_set_x:N = \c_document_structure_topsect_str,
6471   % showignores .bool_set:N = \c_document_structure_showignores_bool,
6472 }
6473 \ProcessKeysOptions{ document-structure / pkg }
6474 \str_if_empty:NT \c_document_structure_class_str {
6475   \str_set:Nn \c_document_structure_class_str {article}
6476 }
6477 \str_if_empty:NT \c_document_structure_topsect_str {
6478   \str_set:Nn \c_document_structure_topsect_str {section}
6479 }

```

Then we need to set up the packages by requiring the `sref` package to be loaded, and set up triggers for other languages

```

6480 \RequirePackage{xspace}
6481 \RequirePackage{comment}
6482 \AddToHook{begindocument}{
6483   \ltx@ifpackageloaded{babel}{
6484     \clist_set:Nx \l_tmpa_clist {\bbl@loaded}
6485     \clist_if_in:NnT \l_tmpa_clist {ngerman}{
6486       \makeatletter\input{document-structure-ngerman.ldf}\makeatother
6487     }
6488   }{}
6489 }

```

`\section@level` Finally, we set the `\section@level` macro that governs sectioning. The default is two (corresponding to the `article` class), then we set the defaults for the standard classes `book` and `report` and then we take care of the levels passed in via the `topsect` option.

```

6490 \int_new:N \l_document_structure_section_level_int
6491 \str_case:VnF \c_document_structure_topsect_str {
6492   {part}}{
6493     \int_set:Nn \l_document_structure_section_level_int {0}
6494   }
6495   {chapter}}{

6509 }

```

37.6 Document Structure

The structure of the document is given by the `omgroup` environment just like in OMDoc. The hierarchy is adjusted automatically according to the \LaTeX class in effect.

`\currentsectionlevel` For the `\currentsectionlevel` and `\Currentsectionlevel` macros we use an internal macro `\current@section@level` that only contains the keyword (no markup). We initialize it with “document” as a default. In the generated OMDoc, we only generate a text element of class `omdoc_currentsectionlevel`, which will be instantiated by CSS later.¹³

EdN:13

```
6510 \def\current@section@level{document}%
6511 \newcommand\currentsectionlevel{\lowercase\expandafter{\current@section@level}\xspace}%
6512 \newcommand\Currentsectionlevel{\expandafter\MakeUppercase\current@section@level\xspace}%
```

(End definition for \currentsectionlevel. This function is documented on page ??.)

`\skipomgroup`

```
6513 \cs_new_protected:Npn \skipomgroup {
6514   \ifcase\l_document_structure_section_level_int
6515   \or\stepcounter{part}
6516   \or\stepcounter{chapter}
6517   \or\stepcounter{section}
6518   \or\stepcounter{subsection}
6519   \or\stepcounter{subsubsection}
6520   \or\stepcounter{paragraph}
6521   \or\stepcounter{subparagraph}
6522   \fi
6523 }
```

(End definition for \skipomgroup. This function is documented on page ??.)

`blindfragment`

```
6524 \newcommand\at@begin@blindomgroup[1]{%
6525   \newenvironment{blindfragment}
6526   {
6527     \int_incr:N\l_document_structure_section_level_int
6528     \at@begin@blindomgroup\l_document_structure_section_level_int
6529   }{}}
```

`\omgroup@nonum` convenience macro: `\omgroup@nonum{<level>}{<title>}` makes an unnumbered sectioning with title `<title>` at level `<level>`.

```
6530 \newcommand\omgroup@nonum[2]{
6531   \ifx\hyper@anchor\@undefined\else\phantomsection\fi
6532   \addcontentsline{toc}{#1}{#2}\@nameuse{#1}*{#2}
6533 }
```

(End definition for \omgroup@nonum. This function is documented on page ??.)

`\omgroup@num` convenience macro: `\omgroup@num{<level>}{<title>}` makes numbered sectioning with title `<title>` at level `<level>`. We have to check the `short` key was given in the `omgroup` environment and – if it is use it. But how to do that depends on whether the `rdfmata` package has been loaded. In the end we call `\sref@label@id` to enable crossreferencing.

```
6534 \newcommand\omgroup@num[2]{
```

¹³EDNOTE: MK: we may have to experiment with the more powerful uppercasing macro from `mfirstuc.sty` once we internationalize.

```

6535 \tl_if_empty:NTF \l__document_structure_omgroup_short_tl {
6536   \@nameuse{#1}{#2}
6537 }{
6538   \cs_if_exist:NTF\rdfmata@sectioning{
6539     \@nameuse{rdfmata@#1@old}[\l__document_structure_omgroup_short_tl]{#2}
6540   }{
6541     \@nameuse{#1}[\l__document_structure_omgroup_short_tl]{#2}
6542   }
6543 }
6544 %\sref@label@id@arg{\omdoc@sect@name~\@nameuse{the#1}}\omgroup@id
6545 }

```

(End definition for \omgroup@num. This function is documented on page ??.)

sfragment

```

6546 \keys_define:nn { document-structure / omgroup }{
6547   id          .str_set_x:N = \l__document_structure_omgroup_id_str,
6548   date        .str_set_x:N = \l__document_structure_omgroup_date_str,
6549   creators    .clist_set:N = \l__document_structure_omgroup_creators_clist,
6550   contributors .clist_set:N = \l__document_structure_omgroup_contributors_clist,
6551   srccite     .tl_set:N    = \l__document_structure_omgroup_srccite_tl,
6552   type        .tl_set:N    = \l__document_structure_omgroup_type_tl,
6553   short       .tl_set:N    = \l__document_structure_omgroup_short_tl,
6554   display     .tl_set:N    = \l__document_structure_omgroup_display_tl,
6555   intro       .tl_set:N    = \l__document_structure_omgroup_intro_tl,
6556   loadmodules .bool_set:N  = \l__document_structure_omgroup_loadmodules_bool
6557 }
6558 \cs_new_protected:Nn \__document_structure_omgroup_args:n {
6559   \str_clear:N \l__document_structure_omgroup_id_str
6560   \str_clear:N \l__document_structure_omgroup_date_str
6561   \clist_clear:N \l__document_structure_omgroup_creators_clist
6562   \clist_clear:N \l__document_structure_omgroup_contributors_clist
6563   \tl_clear:N \l__document_structure_omgroup_srccite_tl
6564   \tl_clear:N \l__document_structure_omgroup_type_tl
6565   \tl_clear:N \l__document_structure_omgroup_short_tl
6566   \tl_clear:N \l__document_structure_omgroup_display_tl
6567   \tl_clear:N \l__document_structure_omgroup_intro_tl
6568   \bool_set_false:N \l__document_structure_omgroup_loadmodules_bool
6569   \keys_set:nn { document-structure / omgroup } { #1 }
6570 }

```

we define a switch for numbering lines and a hook for the beginning of groups: The \at@begin@omgroup macro allows customization. It is run at the beginning of the omgroup, i.e. after the section heading.

```

6571 \newif\if@mainmatter\@mainmattertrue
6572 \newcommand\at@begin@omgroup[3] [] {}

```

Then we define a helper macro that takes care of the sectioning magic. It comes with its own key/value interface for customization.

```

6573 \keys_define:nn { document-structure / sectioning }{
6574   name .str_set_x:N = \l__document_structure_sect_name_str ,
6575   ref .str_set_x:N = \l__document_structure_sect_ref_str ,
6576   clear .bool_set:N = \l__document_structure_sect_clear_bool ,
6577   clear .default:n = {true} ,
6578   num .bool_set:N = \l__document_structure_sect_num_bool ,

```

```

6579   num      .default:n      = {true}
6580 }
6581 \cs_new_protected:Nn \__document_structure_sect_args:n {
6582   \str_clear:N \l__document_structure_sect_name_str
6583   \str_clear:N \l__document_structure_sect_ref_str
6584   \bool_set_false:N \l__document_structure_sect_clear_bool
6585   \bool_set_false:N \l__document_structure_sect_num_bool
6586   \keys_set:nn { document-structure / sectioning } { #1 }
6587 }
6588 \newcommand\omdoc@sectioning[3][]{
6589   \__document_structure_sect_args:n {#1}
6590   \let\omdoc@sect@name\l__document_structure_sect_name_str
6591   \bool_if:NT \l__document_structure_sect_clear_bool { \cleardoublepage }
6592   \if@mainmatter% numbering not overridden by frontmatter, etc.
6593     \bool_if:NTF \l__document_structure_sect_num_bool {
6594       \omgroup@num{#2}{#3}
6595     }{
6596       \omgroup@nonum{#2}{#3}
6597     }
6598     \def\current@section@level{\omdoc@sect@name}
6599   \else
6600     \omgroup@nonum{#2}{#3}
6601   \fi
6602 }% if@mainmatter

```

and another one, if redefines the `\addtocontentsline` macro of L^AT_EX to import the respective macros. It takes as an argument a list of module names.

```

6603 \newcommand\omgroup@redefine@addtocontents[1]{%
6604 %\edef\__document_structureimport{#1}%
6605 %\@for\@I:=\__document_structureimport\do{%
6606 %\edef\@path{\csname module@\@I @path\endcsname}%
6607 %\@ifundefined{tf@toc}\relax%
6608 %   {\protected@write\tf@toc}{\string\@requiremodules{\@path}}}%
6609 %\ifx\hyper@anchor\undefined% hyperref.sty loaded?
6610 %\def\addcontentsline##1##2##3{%
6611 %\addtocontents{##1}{\protect\contentsline{##2}{\string\withusedmodules{##1}{##3}}{\thepage}}%
6612 %\else% hyperref.sty not loaded
6613 %\def\addcontentsline##1##2##3{%
6614 %\addtocontents{##1}{\protect\contentsline{##2}{\string\withusedmodules{##1}{##3}}{\thepage}}%
6615 %\fi
6616 }% hypreref.sty loaded?

```

now the `omgroup` environment itself. This takes care of the table of contents via the helper macro above and then selects the appropriate sectioning command from `article.cls`. It also registers the current level of `omgroups` in the `\omgroup@level` counter.

```

6617 \newenvironment{sfragment}[2][]{% keys, title
6618 {
6619   \__document_structure_omgroup_args:n { #1 }%\sref@target%

```

If the `loadmodules` key is set on `\begin{sfragment}`, we redefine the `\addcontetsline` macro that determines how the sectioning commands below construct the entries for the table of contents.

```

6620 \bool_if:NT \l__document_structure_omgroup_loadmodules_bool {
6621   \omgroup@redefine@addtocontents{
6622     \@ifundefined{module@id}\used@modules%

```

```

6623     %{\@ifundefined{module@module@id @path}{\used@modules}\module@id}
6624   }
6625 }

```

now we only need to construct the right sectioning depending on the value of `\section@level`.

```

6626 \int_incr:N\l_document_structure_section_level_int
6627 \ifcase\l_document_structure_section_level_int
6628   \or\omdoc@sectioning[name=\omdoc@part@kw,clear,num]{part}{#2}
6629   \or\omdoc@sectioning[name=\omdoc@chapter@kw,clear,num]{chapter}{#2}
6630   \or\omdoc@sectioning[name=\omdoc@section@kw,num]{section}{#2}
6631   \or\omdoc@sectioning[name=\omdoc@subsection@kw,num]{subsection}{#2}
6632   \or\omdoc@sectioning[name=\omdoc@subsubsection@kw,num]{subsubsection}{#2}
6633   \or\omdoc@sectioning[name=\omdoc@paragraph@kw,ref=this \omdoc@paragraph@kw]{paragraph}{#2}
6634   \or\omdoc@sectioning[name=\omdoc@subparagraph@kw,ref=this \omdoc@subparagraph@kw]{subparagraph}{#2}
6635 \fi
6636 \at@begin@omgroup[#1]\l_document_structure_section_level_int{#2}
6637 \str_if_empty:NF \l__document_structure_omgroup_id_str {
6638   \stex_ref_new_doc_target:n\l__document_structure_omgroup_id_str
6639 }
6640 }% for customization
6641 {}

```

and finally, we localize the sections

```

6642 \newcommand\omdoc@part@kw{Part}
6643 \newcommand\omdoc@chapter@kw{Chapter}
6644 \newcommand\omdoc@section@kw{Section}
6645 \newcommand\omdoc@subsection@kw{Subsection}
6646 \newcommand\omdoc@subsubsection@kw{Subsubsection}
6647 \newcommand\omdoc@paragraph@kw{paragraph}
6648 \newcommand\omdoc@subparagraph@kw{subparagraph}

```

37.7 Front and Backmatter

Index markup is provided by the `omtext` package [Koh20c], so in the `document-structure` package we only need to supply the corresponding `\printindex` command, if it is not already defined

`\printindex`

```

6649 \providecommand\printindex{\IfFileExists{\jobname.ind}{\input{\jobname.ind}}{}}

```

(End definition for `\printindex`. This function is documented on page ??.)

some classes (e.g. `book.cls`) already have `\frontmatter`, `\mainmatter`, and `\backmatter` macros. As we want to define `frontmatter` and `backmatter` environments, we save their behavior (possibly defining it) in `orig@*matter` macros and make them undefined (so that we can define the environments).

```

6650 \cs_if_exist:NTF\frontmatter{
6651   \let\__document_structure_orig_frontmatter\frontmatter
6652   \let\frontmatter\relax
6653 }{
6654   \tl_set:Nn\__document_structure_orig_frontmatter{
6655     \clearpage
6656     \@mainmatterfalse
6657     \pagenumbering{roman}

```

```

6658 }
6659 }
6660 \cs_if_exist:NTF\backmatter{
6661   \let\__document_structure_orig_backmatter\backmatter
6662   \let\backmatter\relax
6663 }{
6664   \tl_set:Nn\__document_structure_orig_backmatter{
6665     \clearpage
6666     \@mainmatterfalse
6667     \pagenumbering{roman}
6668   }
6669 }

```

Using these, we can now define the `frontmatter` and `backmatter` environments

frontmatter we use the `\orig@frontmatter` macro defined above and `\mainmatter` if it exists, otherwise we define it.

```

6670 \newenvironment{frontmatter}{
6671   \__document_structure_orig_frontmatter
6672 }{
6673   \cs_if_exist:NTF\mainmatter{
6674     \mainmatter
6675   }{
6676     \clearpage
6677     \@mainmattertrue
6678     \pagenumbering{arabic}
6679   }
6680 }

```

backmatter As `backmatter` is at the end of the document, we do nothing for `\endbackmatter`.

```

6681 \newenvironment{backmatter}{
6682   \__document_structure_orig_backmatter
6683 }{
6684   \cs_if_exist:NTF\mainmatter{
6685     \mainmatter
6686   }{
6687     \clearpage
6688     \@mainmattertrue
6689     \pagenumbering{arabic}
6690   }
6691 }

```

finally, we make sure that page numbering is arabic and we have main matter as the default

```

6692 \@mainmattertrue\pagenumbering{arabic}

```

\prematurestop We initialize `\afterprematurestop`, and provide `\prematurestop@endomgroup` which looks up `\omgroup@level` and recursively ends enough `{sfragment}`s.

```

6693 \def \c__document_structure_document_str{document}
6694 \newcommand\afterprematurestop{}
6695 \def\prematurestop@endomgroup{
6696   \unless\ifx\@currenvir\c__document_structure_document_str
6697     \expandafter\expandafter\expandafter\end\expandafter\expandafter\expandafter\expandafter\expandafter
6698     \expandafter\prematurestop@endomgroup

```

```

6699 \fi
6700 }
6701 \providecommand\prematurestop{
6702   \message{Stopping~sTeX~processing~prematurely}
6703   \prematurestop@endgroup
6704   \afterprematurestop
6705   \end{document}}
6706 }

```

(End definition for \prematurestop. This function is documented on page ??.)

37.8 Global Variables

\setSGvar set a global variable

```

6707 \RequirePackage{etoolbox}
6708 \newcommand\setSGvar[1]{\@namedef{sTeX@Gvar@#1}}

```

(End definition for \setSGvar. This function is documented on page ??.)

\useSGvar use a global variable

```

6709 \newrobustcmd\useSGvar[1]{%
6710   \@ifundefined{sTeX@Gvar@#1}
6711   {\PackageError{document-structure}
6712     {The sTeX Global variable #1 is undefined}
6713     {set it with \protect\setSGvar}}
6714   \@nameuse{sTeX@Gvar@#1}}

```

(End definition for \useSGvar. This function is documented on page ??.)

\ifSGvar execute something conditionally based on the state of the global variable.

```

6715 \newrobustcmd\ifSGvar[3]{\def\@test{#2}%
6716   \@ifundefined{sTeX@Gvar@#1}
6717   {\PackageError{document-structure}
6718     {The sTeX Global variable #1 is undefined}
6719     {set it with \protect\setSGvar}}
6720   {\expandafter\ifx\csname sTeX@Gvar@#1\endcsname\@test #3\fi}}

```

(End definition for \ifSGvar. This function is documented on page ??.)

Chapter 38

NotesSlides – Implementation

38.1 Class and Package Options

We define some Package Options and switches for the `notesslides` class and activate them by passing them on to `beamer.cls` and `omdoc.cls` and the `notesslides` package. We pass the `nontheorem` option to the `statements` package when we are not in notes mode, since the `beamer` package has its own (overlay-aware) theorem environments.

```
6721 \*cls)
6722 \@@=notesslides}
6723 \ProvidesExplClass{notesslides}{2022/02/28}{3.1.0}{notesslides Class}
6724 \RequirePackage{13keys2e}
6725
6726 \keys_define:nn{notesslides / cls}{
6727   class .code:n = {
6728     \PassOptionsToClass{\CurrentOption}{document-structure}
6729     \str_if_eq:nnT{#1}{book}{
6730       \PassOptionsToPackage{defaulttopsec=part}{notesslides}
6731     }
6732     \str_if_eq:nnT{#1}{report}{
6733       \PassOptionsToPackage{defaulttopsec=part}{notesslides}
6734     }
6735   },
6736   notes .bool_set:N = \c__notesslides_notes_bool ,
6737   slides .code:n = { \bool_set_false:N \c__notesslides_notes_bool },
6738   unknown .code:n = {
6739     \PassOptionsToClass{\CurrentOption}{document-structure}
6740     \PassOptionsToClass{\CurrentOption}{beamer}
6741     \PassOptionsToPackage{\CurrentOption}{notesslides}
6742   }
6743 }
6744 \ProcessKeysOptions{ notesslides / cls }
6745 \bool_if:NTF \c__notesslides_notes_bool {
6746   \PassOptionsToPackage{notes=true}{notesslides}
6747 }{
6748   \PassOptionsToPackage{notes=false}{notesslides}
6749 }
6750 \</cls>
```

now we do the same for the notesslides package.

```

6751 <*package>
6752 \ProvidesExplPackage{notesslides}{2022/02/28}{3.1.0}{notesslides Package}
6753 \RequirePackage{13keys2e}
6754
6755 \keys_define:nn{notesslides / pkg}{
6756   topsect          .str_set_x:N = \c__notesslides_topsect_str,
6757   defaulttopsect   .str_set_x:N = \c__notesslides_defaulttopsec_str,
6758   notes            .bool_set:N = \c__notesslides_notes_bool ,
6759   slides           .code:n      = { \bool_set_false:N \c__notesslides_notes_bool },
6760   sectocframes     .bool_set:N = \c__notesslides_sectocframes_bool ,
6761   frameimages      .bool_set:N = \c__notesslides_frameimages_bool ,
6762   fiboxed          .bool_set:N = \c__notesslides_fiboxed_bool ,
6763   noproblems       .bool_set:N = \c__notesslides_noproblems_bool,
6764   unknown          .code:n      = {
6765     \PassOptionsToClass{\CurrentOption}{stex}
6766     \PassOptionsToClass{\CurrentOption}{tikzinput}
6767   }
6768 }
6769 \ProcessKeysOptions{ notesslides / pkg }
6770 \newif\ifnotes
6771 \bool_if:NTF \c__notesslides_notes_bool {
6772   \notesttrue
6773 }{
6774   \notesfalse
6775 }
6776

```

we give ourselves a macro \@@topsect that needs only be evaluated once, so that the \ifdefstring conditionals work below.

```

6777 \str_if_empty:NTF \c__notesslides_topsect_str {
6778   \str_set_eq:NN \__notesslides_topsect \c__notesslides_defaulttopsec_str
6779 }{
6780   \str_set_eq:NN \__notesslides_topsect \c__notesslides_topsect_str
6781 }
6782 </package>

```

Depending on the options, we either load the article-based document-structure or the beamer class (and set some counters).

```

6783 <*cls>
6784 \bool_if:NTF \c__notesslides_notes_bool {
6785   \LoadClass{document-structure}
6786 }{
6787   \LoadClass[10pt,notheorems,xcolor={dvipsnames,svgnames}]{beamer}
6788   \newcounter{Item}
6789   \newcounter{paragraph}
6790   \newcounter{subparagraph}
6791   \newcounter{Hfootnote}
6792   \RequirePackage{document-structure}
6793 }

```

now it only remains to load the notesslides package that does all the rest.

```

6794 \RequirePackage{notesslides}
6795 </cls>

```

In `notes` mode, we also have to make the `beamer`-specific things available to `article` via the `beamerarticle` package. We use options to avoid loading theorem-like environments, since we want to use our own from the `STEX` packages. The first batch of packages we want are loaded on `notesslides.sty`. These are the general ones, we will load the `STEX`-specific ones after we have done some work (e.g. defined the counters `m*`). Only the `stex-logo` package is already needed now for the default theme.

```

6796 \*package>
6797 \bool_if:NT \c__notesslides_notes_bool {
6798   \RequirePackage{a4wide}
6799   \RequirePackage{marginnote}
6800   \PassOptionsToPackage{usenames,dvipsnames,svgnames}{xcolor}
6801   \RequirePackage{mdframed}
6802   \RequirePackage[noxcolor,noamsthm]{beamerarticle}
6803   \RequirePackage[bookmarks,bookmarksopen,bookmarksnumbered,breaklinks,hidelinks]{hyperref}
6804 }
6805 \RequirePackage{stex-tikzinput}
6806 \RequirePackage{etoolbox}
6807 \RequirePackage{amssymb}
6808 \RequirePackage{amsmath}
6809 \RequirePackage{comment}
6810 \RequirePackage{textcomp}
6811 \RequirePackage{url}
6812 \RequirePackage{graphicx}
6813 \RequirePackage{pgf}

```

38.2 Notes and Slides

For the lecture notes cases, we also provide the `\usetheme` macro that would otherwise come from the `beamer` class. While the latter loads `beamertheme<theme>.sty`, the notes version loads `beamernotestheme<theme>.sty`.¹⁴

```

6814 \bool_if:NT \c__notesslides_notes_bool {
6815   \renewcommand\usetheme[2][\usepackage[#1]{beamernotestheme#2}]
6816 }
6817
6818
6819 \NewDocumentCommand \libusetheme {0{} m} {
6820   \bool_if:NTF \c__notesslides_notes_bool {
6821     \libusepackage[#1]{beamernotestheme#2}
6822   }{
6823     \libusepackage[#1]{beamertheme#2}
6824   }
6825 }

```

We define the sizes of slides in the notes. Somehow, we cannot get by with the same here.

```

6826 \newcounter{slide}
6827 \newlength{\slidewidth}\setlength{\slidewidth}{13.5cm}
6828 \newlength{\slideheight}\setlength{\slideheight}{9cm}

```

¹⁴EdNOTE: MK: This is not ideal, but I am not sure that I want to be able to provide the full theme functionality there.

note The `note` environment is used to leave out text in the `slides` mode. It does not have a counterpart in OMDoc. So for course notes, we define the `note` environment to be a no-operation otherwise we declare the `note` environment as a comment via the `comment` package.

```

6829 \bool_if:NTF \c__notesslides_notes_bool {
6830   \renewenvironment{note}{\ignorespaces}{\}
6831 }{
6832   \excludecomment{note}
6833 }

```

We first set up the slide boxes in `article` mode. We set up sizes and provide a box register for the frames and a counter for the slides.

```

6834 \bool_if:NT \c__notesslides_notes_bool {
6835   \newlength{\slideframewidth}
6836   \setlength{\slideframewidth}{1.5pt}

```

frame We first define the keys.

```

6837 \cs_new_protected:Nn \__notesslides_do_yes_param:Nn {
6838   \exp_args:Nx \str_if_eq:nnTF { \str_uppercase:n{ #2 } }{ yes }{
6839     \bool_set_true:N #1
6840   }{
6841     \bool_set_false:N #1
6842   }
6843 }
6844 \keys_define:nn{notesslides / frame}{
6845   label .str_set_x:N = \l__notesslides_frame_label_str,
6846   allowframebreaks .code:n = {
6847     \__notesslides_do_yes_param:Nn \l__notesslides_frame_allowframebreaks_bool { #1 }
6848   },
6849   allowdisplaybreaks .code:n = {
6850     \__notesslides_do_yes_param:Nn \l__notesslides_frame_allowdisplaybreaks_bool { #1 }
6851   },
6852   fragile .code:n = {
6853     \__notesslides_do_yes_param:Nn \l__notesslides_frame_fragile_bool { #1 }
6854   },
6855   shrink .code:n = {
6856     \__notesslides_do_yes_param:Nn \l__notesslides_frame_shrink_bool { #1 }
6857   },
6858   squeeze .code:n = {
6859     \__notesslides_do_yes_param:Nn \l__notesslides_frame_squeeze_bool { #1 }
6860   },
6861   t .code:n = {
6862     \__notesslides_do_yes_param:Nn \l__notesslides_frame_t_bool { #1 }
6863   },
6864 }
6865 \cs_new_protected:Nn \__notesslides_frame_args:n {
6866   \str_clear:N \l__notesslides_frame_label_str
6867   \bool_set_true:N \l__notesslides_frame_allowframebreaks_bool
6868   \bool_set_true:N \l__notesslides_frame_allowdisplaybreaks_bool
6869   \bool_set_true:N \l__notesslides_frame_fragile_bool
6870   \bool_set_true:N \l__notesslides_frame_shrink_bool
6871   \bool_set_true:N \l__notesslides_frame_squeeze_bool
6872   \bool_set_true:N \l__notesslides_frame_t_bool

```

```

6873 \keys_set:nn { notesslides / frame }{ #1 }
6874 }

```

We define the environment, read them, and construct the slide number and label.

```

6875 \renewenvironment{frame}[1][]{
6876 \_notesslides_frame_args:n{#1}
6877 \sffamily
6878 \stepcounter{slide}
6879 \def\@currentlabel{\theslide}
6880 \str_if_empty:NF \l__notesslides_frame_label_str {
6881 \label{\l__notesslides_frame_label_str}
6882 }

```

We redefine the `itemize` environment so that it looks more like the one in `beamer`.

```

6883 \def\itemize@level{outer}
6884 \def\itemize@outer{outer}
6885 \def\itemize@inner{inner}
6886 \renewcommand\newpage{\addtocounter{framenumber}{1}}
6887 \newcommand\metakeys@show@keys[2]{\marginnote{\scriptsize ##2}}
6888 \renewenvironment{itemize}{
6889 \ifx\itemize@level\itemize@outer
6890 \def\itemize@label{$\rhd$}
6891 \fi
6892 \ifx\itemize@level\itemize@inner
6893 \def\itemize@label{$\scriptstyle\rhd$}
6894 \fi
6895 \begin{list}
6896 {\itemize@label}
6897 {\setlength{\labelsep}{.3em}
6898 \setlength{\labelwidth}{.5em}
6899 \setlength{\leftmargin}{1.5em}
6900 }
6901 \edef\itemize@level{\itemize@inner}
6902 }{
6903 \end{list}
6904 }

```

We create the box with the `mdframed` environment from the `equinymous` package.

```

6905 \begin{mdframed}[linewidth=\slideframewidth,skipabove=1ex,skipbelow=1ex,userdefinedwidth]
6906 }{
6907 \medskip\miko@slidelabel\end{mdframed}
6908 }

```

Now, we need to redefine the `frametitle` (we are still in course notes mode).

`\frametitle`

```

6909 \renewcommand{\frametitle}[1]{\Large\bf\sf\color{blue}{#1}}\medskip
6910 }

```

(End definition for `\frametitle`. This function is documented on page ??.)

EdN:15

`\pause`

```

15
6911 \bool_if:NT \c__notesslides_notes_bool {
6912 \newcommand\pause{}
6913 }

```

¹⁵EdNOTE: MK: fake it in notes mode for now

(End definition for \pause. This function is documented on page ??.)

nparagraph

```
6914 \bool_if:NTF \c__notesslides_notes_bool {
6915   \newenvironment{nparagraph}[1] [] {\begin{sparagraph}[#1]}\end{sparagraph}}
6916 }{
6917   \excludecomment{nparagraph}
6918 }
```

nfragment

```
6919 \bool_if:NTF \c__notesslides_notes_bool {

6940   \newenvironment{nexample}[1] [] {\begin{sexample}[#1]}\end{sexample}}
6941 }{
6942   \excludecomment{nexample}
6943 }
```

\inputref@*skip We customize the hooks for in \inputref.

```
6944 \def\inputref@preskip{\smallskip}
6945 \def\inputref@postskip{\medskip}
```

(End definition for \inputref@*skip. This function is documented on page ??.)

`\inputref*`

```
6946 \let\orig@inputref\inputref
6947 \def\inputref{\@ifstar\ninputref\orig@inputref}
6948 \newcommand\ninputref[2][] {
6949   \bool_if:NT \c__notesslides_notes_bool {
6950     \orig@inputref[#1]{#2}
6951   }
6952 }
```

(End definition for `\inputref*`. This function is documented on page ??.)

38.3 Header and Footer Lines

Now, we set up the infrastructure for the footer line of the slides, we use boxes for the logos, so that they are only loaded once, that considerably speeds up processing.

`\setslidelogo` The default logo is the \TeX logo. Customization can be done by `\setslidelogo{<logo name>}`.

```
6953 \newlength{\slidelogoheight}
6954
6955 \bool_if:NTF \c__notesslides_notes_bool {
6956   \setlength{\slidelogoheight}{.4cm}
6957 }{
6958   \setlength{\slidelogoheight}{1cm}
6959 }
6960 \newsavebox{\slidelogo}
6961 \sbox{\slidelogo}{\text{\TeX}}
6962 \newrobustcmd{\setslidelogo}[1]{
6963   \sbox{\slidelogo}{\includegraphics[height=\slidelogoheight]{#1}}
6964 }
```

(End definition for `\setslidelogo`. This function is documented on page ??.)

`\setsource` `\source` stores the writer's name. By default it is *Michael Kohlhase* since he is the main user and designer of this package. `\setsource{<name>}` can change the writer's name.

```
6965 \def\source{Michael Kohlhase}% customize locally
6966 \newrobustcmd{\setsource}[1]{\def\source{#1}}
```

(End definition for `\setsource`. This function is documented on page ??.)

`\setlicensing` Now, we set up the copyright and licensing. By default we use the Creative Commons Attribution-ShareAlike license to strengthen the public domain. If package `hyperref` is loaded, then we can attach a hyperlink to the license logo. `\setlicensing[<url>]{<logo name>}` is used for customization, where `<url>` is optional.

```
6967 \def\copyrightnotice{\footnotesize\copyright : \hspace{.3ex}{\source}}
6968 \newsavebox{\cclogo}
6969 \sbox{\cclogo}{\includegraphics[height=\slidelogoheight]{stex-cc_somerights}}
6970 \newif\ifcchref\cchreffalse
6971 \AtBeginDocument{
6972   \ifpackageloaded{hyperref}{\cchreftrue}{\cchreffalse}
6973 }
6974 \def\licensing{
6975   \ifcchref
```

```

6976 \href{http://creativecommons.org/licenses/by-sa/2.5/}{\usebox{\cclogo}}
6977 \else
6978   {\usebox{\cclogo}}
6979 \fi
6980 }
6981 \newrobustcmd{\setlicensing}[2][]{
6982   \def\@url{#1}
6983   \sbox{\cclogo}{\includegraphics[height=\slidelogoheight]{#2}}
6984   \ifx\@url\@empty
6985     \def\licensing{\usebox{\cclogo}}
6986   \else
6987     \def\licensing{
6988       \ifcchref
6989         \href{#1}{\usebox{\cclogo}}
6990       \else
6991         {\usebox{\cclogo}}
6992       \fi
6993     }
6994   \fi
6995 }

```

(End definition for \setlicensing. This function is documented on page ??.)

EdN:16

\slidelabel Now, we set up the slide label for the article mode.¹⁶

```

6996 \newrobustcmd\miko@slidelabel{
6997   \vbox to \slidelogoheight{
6998     \vss\hbox to \slidewidth
6999     {\licensing\hfill\copyrightnotice\hfill\arabic{slide}\hfill\usebox{\slidelogo}}
7000   }
7001 }

```

(End definition for \slidelabel. This function is documented on page ??.)

38.4 Frame Images

\frameimage We have to make sure that the width is overwritten, for that we check the \Gin@ewidth macro from the graphicx package. We also add the label key.

```

7002 \def\Gin@mhrepos{}
7003 \define@key{Gin}{mhrepos}{\def\Gin@mhrepos{#1}}
7004 \define@key{Gin}{label}{\def\@currentlabel{\arabic{slide}}\label{#1}}
7005 \newrobustcmd\frameimage[2][]{
7006   \stepcounter{slide}
7007   \bool_if:NT \c__notesslides_frameimages_bool {
7008     \def\Gin@ewidth{}\setkeys{Gin}{#1}
7009     \bool_if:NF \c__notesslides_notes_bool { \vfill }
7010     \begin{center}
7011       \bool_if:NTF \c__notesslides_fiboxed_bool {
7012         \fbox{
7013           \ifx\Gin@ewidth\@empty
7014             \ifx\Gin@mhrepos\@empty
7015               \mhgraphics[width=\slidewidth,#1]{#2}
7016             \else

```

¹⁶EdNOTE: see that we can use the themes for the slides some day. This is all fake.

```

7017         \mhgraphics[width=\slidewidth,#1,mhrepos=\Gin@mhrepos]{#2}
7018     \fi
7019 \else% Gin@ewidth empty
7020     \ifx\Gin@mhrepos\@empty
7021         \mhgraphics[#1]{#2}
7022     \else
7023         \mhgraphics[#1,mhrepos=\Gin@mhrepos]{#2}
7024     \fi
7025 \fi% Gin@ewidth empty
7026 }
7027 }{
7028     \ifx\Gin@ewidth\@empty
7029     \ifx\Gin@mhrepos\@empty
7030         \mhgraphics[width=\slidewidth,#1]{#2}
7031     \else
7032         \mhgraphics[width=\slidewidth,#1,mhrepos=\Gin@mhrepos]{#2}
7033     \fi
7034     \ifx\Gin@mhrepos\@empty
7035         \mhgraphics[#1]{#2}
7036     \else
7037         \mhgraphics[#1,mhrepos=\Gin@mhrepos]{#2}
7038     \fi
7039 \fi% Gin@ewidth empty
7040 }
7041 \end{center}
7042 \par\strut\hfill{\footnotesize Slide \arabic{slide}}}%
7043 \bool_if:NF \c__notesslides_notes_bool { \vfill }
7044 }
7045 } % ifmks@sty@frameimages

```

(End definition for `\frameimage`. This function is documented on page ??.)

38.5 Colors and Highlighting

We first specify sans serif fonts as the default.

```

7046 \sffamily

```

Now, we set up an infrastructure for highlighting phrases in slides. Note that we use content-oriented macros for highlighting rather than directly using color markup. The first thing to do is to adapt the green so that it is dark enough for most beamers

```

7047 \AddToHook{begindocument}{
7048     \definecolor{green}{rgb}{0,.5,0}
7049     \definecolor{purple}{cmyk}{.3,1,0,.17}
7050 }

```

We customize the `\defemph`, `\symrefemph`, `\compemph`, and `\titleemph` macros with colors. Furthermore we customize the `__omtextlec` macro for the appearance of line end comments in `\lec`.

```

7051 % \def\STpresent#1{\textcolor{blue}{#1}}
7052 \def\defemph#1{\textcolor{magenta}{#1}}
7053 \def\symrefemph#1{\textcolor{cyan}{#1}}
7054 \def\compemph#1{\textcolor{blue}{#1}}
7055 \def\titleemph#1{\textcolor{blue}{#1}}
7056 \def\__omtext_lec#1{\textcolor{green}{#1}}

```

I like to use the dangerous bend symbol for warnings, so we provide it here.

`\textwarning` as the macro can be used quite often we put it into a box register, so that it is only loaded once.

```

7057 \pgfdeclareimage[width=.8em]{miko@small@dbend}{stex-dangerous-bend}
7058 \def\smalltextwarning{
7059   \pgfuseimage{miko@small@dbend}
7060   \xspace
7061 }
7062 \pgfdeclareimage[width=1.2em]{miko@dbend}{stex-dangerous-bend}
7063 \newrobustcmd\textwarning{
7064   \raisebox{-.05cm}{\pgfuseimage{miko@dbend}}
7065   \xspace
7066 }
7067 \pgfdeclareimage[width=2.5em]{miko@big@dbend}{stex-dangerous-bend}
7068 \newrobustcmd\bigtextwarning{
7069   \raisebox{-.05cm}{\pgfuseimage{miko@big@dbend}}
7070   \xspace
7071 }

```

(End definition for `\textwarning`. This function is documented on page ??.)

```

7072 \newrobustcmd\putgraphicsat[3]{
7073   \begin{picture}(0,0)\put(#1){\includegraphics[#2]{#3}}\end{picture}
7074 }
7075 \newrobustcmd\putat[2]{
7076   \begin{picture}(0,0)\put(#1){#2}\end{picture}
7077 }

```

38.6 Sectioning

If the `sectocframes` option is set, then we make section frames. We first define counters for `part` and `chapter`, which `beamer.cls` does not have and we make the `section` counter which it does dependent on `chapter`.

```

7078 \bool_if:NT \c__notesslides_sectocframes_bool {
7079   \str_if_eq:VnTF \__notesslidesstopsect{part}{
7080     \newcounter{chapter}\counterwithin*{section}{chapter}
7081   }{
7082     \str_if_eq:VnT \__notesslidesstopsect{chapter}{
7083       \newcounter{chapter}\counterwithin*{section}{chapter}
7084     }
7085   }
7086 }

```

`\section@level` We set the `\section@level` counter that governs sectioning according to the class options. We also introduce the sectioning counters accordingly.

```

\section@level
7087 \def\part@prefix{}
7088 \@ifpackageloaded{document-structure}{}{
7089   \str_case:VnF \__notesslidesstopsect {
7090     {part}{
7091       \int_set:Nn \l_document_structure_section_level_int {0}
7092       \def\thesection{\arabic{chapter}.\arabic{section}}

```

```

7093     \def\part@prefix{\arabic{chapter}.}
7094   }
7095   {chapter}{
7096     \int_set:Nn \l_document_structure_section_level_int {1}
7097     \def\thesection{\arabic{chapter}.\arabic{section}}
7098     \def\part@prefix{\arabic{chapter}.}
7099   }
7100 }{
7101   \int_set:Nn \l_document_structure_section_level_int {2}
7102   \def\part@prefix{}
7103 }
7104 }
7105
7106 \bool_if:NF \c__notesslides_notes_bool { % only in slides

```

(End definition for \section@level. This function is documented on page ??.)

The new counters are used in the `omgroup` environment that chooses the L^AT_EX sectioning macros according to `\section@level`.

sfragment

```

7107 \renewenvironment{sfragment}[2][]{
7108   \_document_structure_omgroup_args:n { #1 }

7187 }

```

38.7 Excursions

`\excursion` The excursion macros are very simple, we define a new internal macro `\excursionref` and use it in `\excursion`, which is just an `\inputref` that checks if the new macro is defined before formatting the file in the argument.

```

7188 \gdef\printexcursions{}
7189 \newcommand\excursionref[2]{% label, text
7190   \bool_if:NT \c__notesslides_notes_bool {
7191     \begin{sparagraph}[title=Excursion]
7192       #2 \sref[fallback=the appendix]{#1}.
7193     \end{sparagraph}
7194   }
7195 }
7196 \newcommand\activate@excursion[2][]{
7197   \gappto\printexcursions{\inputref{#1}{#2}}
7198 }
7199 \newcommand\excursion[4][]{% repos, label, path, text
7200   \bool_if:NT \c__notesslides_notes_bool {
7201     \activate@excursion[#1]{#3}\excursionref{#2}{#4}
7202   }
7203 }

```

(End definition for `\excursion`. This function is documented on page ??.)

`\excursiongroup`

```

7204 \keys_define:nn{notesslides / excursiongroup }{
7205   id          .str_set_x:N = \l__notesslides_excursion_id_str,
7206   intro       .tl_set:N   = \l__notesslides_excursion_intro_tl,
7207   mhrepos     .str_set_x:N = \l__notesslides_excursion_mhrepos_str
7208 }
7209 \cs_new_protected:Nn \__notesslides_excursion_args:n {

7223       }
7224     }
7225     \printexcursions%
7226     \end{sfragment}
7227   \end{note}}
7228 }
7229 \ifcsname beameritemnestingprefix\endcsname\else\def\beameritemnestingprefix{\fi
7230 \</package>

```

(End definition for `\excursiongroup`. This function is documented on page ??.)

Chapter 39

The Implementation

39.1 Package Options

The first step is to declare (a few) package options that handle whether certain information is printed or not. They all come with their own conditionals that are set by the options.

```
7231 <*package>
7232 <@@=problems>
7233 \ProvidesExplPackage{problem}{2022/02/26}{3.0.1}{Semantic Markup for Problems}
7234 \RequirePackage{l3keys2e,stex}
7235
7236 \keys_define:nn { problem / pkg }{
7237   notes      .default:n    = { true },
7238   notes      .bool_set:N   = \c__problems_notes_bool,
7239   gnotes     .default:n    = { true },
7240   gnotes     .bool_set:N   = \c__problems_gnotes_bool,
7241   hints      .default:n    = { true },
7242   hints      .bool_set:N   = \c__problems_hints_bool,
7243   solutions  .default:n    = { true },
7244   solutions  .bool_set:N   = \c__problems_solutions_bool,
7245   pts        .default:n    = { true },
7246   pts        .bool_set:N   = \c__problems_pts_bool,
7247   min        .default:n    = { true },
7248   min        .bool_set:N   = \c__problems_min_bool,
7249   boxed      .default:n    = { true },
7250   boxed      .bool_set:N   = \c__problems_boxed_bool,
7251   unknown    .code:n       = {}
7252 }
7253 \newif\ifsolutions
7254
7255 \ProcessKeysOptions{ problem / pkg }
7256 \bool_if:NTF \c__problems_solutions_bool {
7257   \solutionstrue
7258 }{
7259   \solutionsfalse
7260 }
```

Then we make sure that the necessary packages are loaded (in the right versions).

```
7261 \RequirePackage{comment}
```

The next package relies on the L^AT_EX3 kernel, which L^AT_EXML only partially supports. As it is purely presentational, we only load it when the boxed option is given and we run L^AT_EXML.

```
7262 \bool_if:NT \c__problems_boxed_bool { \RequirePackage{mdframed} }
```

\prob@*@kw For multilinguality, we define internal macros for keywords that can be specialized in *.ldf files.

```
7263 \def\prob@problem@kw{Problem}
7264 \def\prob@solution@kw{Solution}
7265 \def\prob@hint@kw{Hint}
7266 \def\prob@note@kw{Note}
7267 \def\prob@gnote@kw{Grading}
7268 \def\prob@pt@kw{pt}
7269 \def\prob@min@kw{min}
```

(End definition for \prob@*@kw. This function is documented on page ??.)

For the other languages, we set up triggers

```
7270 \AddToHook{begindocument}{
7271   \ltx@ifpackageloaded{babel}{
7272     \makeatletter
7273     \clist_set:Nx \l_tmpa_clist {\bbl@loaded}
7274     \clist_if_in:NnT \l_tmpa_clist {ngerman}{
7275       \input{problem-ngerman.ldf}
7276     }
7277     \clist_if_in:NnT \l_tmpa_clist {finnish}{
7278       \input{problem-finnish.ldf}
7279     }
7280     \clist_if_in:NnT \l_tmpa_clist {french}{
7281       \input{problem-french.ldf}
7282     }
7283     \clist_if_in:NnT \l_tmpa_clist {russian}{
7284       \input{problem-russian.ldf}
7285     }
7286     \makeatother
7287   }{ }
7288 }
```

39.2 Problems and Solutions

We now prepare the KeyVal support for problems. The key macros just set appropriate internal macros.

```
7289 \keys_define:nn{ problem / problem }{
7290   id      .str_set:x:N = \l__problems_prob_id_str,
7291   pts     .tl_set:N    = \l__problems_prob_pts_tl,
7292   min     .tl_set:N    = \l__problems_prob_min_tl,
7293   title   .tl_set:N    = \l__problems_prob_title_tl,
7294   type    .tl_set:N    = \l__problems_prob_type_tl,
7295   refnum  .int_set:N    = \l__problems_prob_refnum_int
7296 }
7297 \cs_new_protected:Nn \__problems_prob_args:n {
```

```

7298 \str_clear:N \l__problems_prob_id_str
7299 \tl_clear:N \l__problems_prob_pts_tl
7300 \tl_clear:N \l__problems_prob_min_tl
7301 \tl_clear:N \l__problems_prob_title_tl
7302 \tl_clear:N \l__problems_prob_type_tl
7303 \int_zero_new:N \l__problems_prob_refnum_int
7304 \keys_set:nn { problem / problem }{ #1 }
7305 \int_compare:nNnT \l__problems_prob_refnum_int = 0 {
7306   \let\l__problems_prob_refnum_int\undefined
7307 }
7308 }

```

Then we set up a counter for problems.

`\numberproblemsin`

```

7309 \newcounter{problem}
7310 \newcommand\numberproblemsin[1]{\@addtoreset{problem}{#1}}

```

(End definition for `\numberproblemsin`. This function is documented on page ??.)

`\prob@label` We provide the macro `\prob@label` to redefine later to get context involved.

```

7311 \newcommand\prob@label[1]{#1}

```

(End definition for `\prob@label`. This function is documented on page ??.)

`\prob@number` We consolidate the problem number into a reusable internal macro

```

7312 \newcommand\prob@number{
7313   \int_if_exist:NTF \l__problems_inclprob_refnum_int {
7314     \prob@label{\int_use:N \l__problems_inclprob_refnum_int }
7315   }{
7316     \int_if_exist:NTF \l__problems_prob_refnum_int {
7317       \prob@label{\int_use:N \l__problems_prob_refnum_int }
7318     }{
7319       \prob@label\theproblem
7320     }
7321   }
7322 }

```

(End definition for `\prob@number`. This function is documented on page ??.)

`\prob@title` We consolidate the problem title into a reusable internal macro as well. `\prob@title` takes three arguments the first is the fallback when no title is given at all, the second and third go around the title, if one is given.

```

7323 \newcommand\prob@title[3]{%
7324   \tl_if_exist:NTF \l__problems_inclprob_title_tl {
7325     #2 \l__problems_inclprob_title_tl #3
7326   }{
7327     \tl_if_exist:NTF \l__problems_prob_title_tl {
7328       #2 \l__problems_prob_title_tl #3
7329     }{
7330       #1
7331     }
7332   }
7333 }

```

(End definition for `\prob@title`. This function is documented on page ??.)

With these the problem header is a one-liner

`\prob@heading` We consolidate the problem header line into a separate internal macro that can be reused in various settings.

```

7334 \def\prob@heading{
7335   {\prob@problem@kw}\ \prob@number\prob@title{~}{~}{~}\strut}
7336   %\sref@label{id}\prob@problem@kw~\prob@number}{~}
7337 }

```

(End definition for `\prob@heading`. This function is documented on page ??.)

With this in place, we can now define the `problem` environment. It comes in two shapes, depending on whether we are in boxed mode or not. In both cases we increment the problem number and output the points and minutes (depending) on whether the respective options are set.

`sproblem`

```

7338 \newenvironment{sproblem}[1][]{
7339   \__problems_prob_args:n{#1}%\sref@target%
7340   \@in@omtexttrue% we are in a statement (for inline definitions)
7341   \stepcounter{problem}\record@problem
7342   \def\current@section@level{\prob@problem@kw}

7423       }
7424     }
7425   }
7426 }

```

(End definition for \record@problem. This function is documented on page ??.)

\@problem This macro acts on a problem's record in the *.aux file. It does not have any functionality here, but can be redefined elsewhere (e.g. in the assignment package).

```
7427 \def\@problem#1#2#3{}
```

(End definition for \@problem. This function is documented on page ??.)

solution The **solution** environment is similar to the **problem** environment, only that it is independent of the boxed mode. It also has it's own keys that we need to define first.

```
7428 \keys_define:nn { problem / solution }{
7429   id                .str_set_x:N = \l__problems_solution_id_str ,
7430   for               .tl_set:N   = \l__problems_solution_for_tl ,
7431   height            .dim_set:N  = \l__problems_solution_height_dim ,
7432   creators          .clist_set:N = \l__problems_solution_creators_clist ,
7433   contributors      .clist_set:N = \l__problems_solution_contributors_clist ,
7434   srccite           .tl_set:N   = \l__problems_solution_srccite_tl
7435 }
7436 \cs_new_protected:Nn \__problems_solution_args:n {
7437   \str_clear:N \l__problems_solution_id_str
7438   \tl_clear:N \l__problems_solution_for_tl
7439   \tl_clear:N \l__problems_solution_srccite_tl
7440   \clist_clear:N \l__problems_solution_creators_clist
7441   \clist_clear:N \l__problems_solution_contributors_clist
7442   \dim_zero:N \l__problems_solution_height_dim
7443   \keys_set:nn { problem / solution }{ #1 }
7444 }
```

the next step is to define a helper macro that does what is needed to start a solution.

```
7445 \newcommand\@startsolution[1][{}]{
7446   \__problems_solution_args:n { #1 }
7447   \@in@omtexttrue% we are in a statement.
7448   \bool_if:NF \c__problems_boxed_bool { \hrule }
7449   \smallskip\noindent
7450   {\textbf\prob@solution@kw : \enspace}
7451   \begin{small}
7452   \def\current@section@level{\prob@solution@kw}
7453   \ignorespacesandpars
7454 }
```

\startsolutions for the **\startsolutions** macro we use the **\specialcomment** macro from the **comment** package. Note that we use the **\@startsolution** macro in the start codes, that parses the optional argument.

```
7455 \newcommand\startsolutions{
7456   \specialcomment{solution}{\@startsolution}{
7457     \bool_if:NF \c__problems_boxed_bool {
7458       \hrule\medskip
7459     }
7460     \end{small}%
7461   }
7462   \bool_if:NT \c__problems_boxed_bool {
7463     \surroundwithmdframed{solution}
7464   }
7465 }
```

(End definition for \startsolutions. This function is documented on page ??.)

\stopsolutions

```
7466 \newcommand\stopsolutions{\excludecomment{solution}}
```

(End definition for \stopsolutions. This function is documented on page ??.)

so it only remains to start/stop solutions depending on what option was specified.

```
7467 \ifsolutions
7468   \startsolutions
7469 \else
7470   \stopsolutions
7471 \fi
```

7606   \let\l__problems_inclprob_refnum_int\undefined
7607   \let\l__problems_inclprob_mhrepos_str\undefined
7608 }
7609 \__problems_inclprob_clear:
7610
7611 \newcommand\includeproblem[2][ ]{
7612   \__problems_inclprob_args:n{ #1 }
7613   \str_if_empty:NTF \l__problems_inclprob_mhrepos_str {
7614     \input{#2}
7615   }{
7616     \stex_in_repository:nn{\l__problems_inclprob_mhrepos_str}{
7617       \input{\mhpath{\l__problems_inclprob_mhrepos_str}{#2}}
7618     }
7619   }
7620   \__problems_inclprob_clear:
7621 }

```

(End definition for \includeproblem. This function is documented on page ??.)

39.5 Reporting Metadata

For messages it is OK to have them in English as the whole documentation is, and we can therefore assume authors can deal with it.

```

7622 \AddToHook{enddocument}{
7623   \bool_if:NT \c__problems_pts_bool {
7624     \message{Total:~\arabic{pts}~points}
7625   }
7626   \bool_if:NT \c__problems_min_bool {
7627     \message{Total:~\arabic{min}~minutes}
7628   }
7629 }

```

The margin pars are reader-visible, so we need to translate

```

7630 \def\pts#1{
7631   \bool_if:NT \c__problems_pts_bool {
7632     \marginpar{#1~\prob@pt@kw}
7633   }
7634 }
7635 \def\min#1{
7636   \bool_if:NT \c__problems_min_bool {
7637     \marginpar{#1~\prob@min@kw}
7638   }
7639 }

```

`\show@pts` The `\show@pts` shows the points: if no points are given from the outside and also no points are given locally do nothing, else show and add. If there are outside points then we show them in the margin.

```

7640 \newcounter{pts}
7641 \def\show@pts{
7642   \tl_if_exist:NTF \l__problems_inclprob_pts_tl {
7643     \bool_if:NT \c__problems_pts_bool {
7644       \marginpar{\l__problems_inclprob_pts_tl\ \prob@pt@kw\smallskip}
7645       \addtocounter{pts}{\l__problems_inclprob_pts_tl}
7646     }
7647   }{
7648     \tl_if_exist:NT \l__problems_prob_pts_tl {
7649       \bool_if:NT \c__problems_pts_bool {
7650         \marginpar{\l__problems_prob_pts_tl\ \prob@pt@kw\smallskip}
7651         \addtocounter{pts}{\l__problems_prob_pts_tl}
7652       }
7653     }
7654   }
7655 }

```

(End definition for `\show@pts`. This function is documented on page ??.)
and now the same for the minutes

`\show@min`

```

7656 \newcounter{min}
7657 \def\show@min{
7658   \tl_if_exist:NTF \l__problems_inclprob_min_tl {
7659     \bool_if:NT \c__problems_min_bool {
7660       \marginpar{\l__problems_inclprob_min_tl\ min}
7661       \addtocounter{min}{\l__problems_inclprob_min_tl}
7662     }
7663   }{
7664     \tl_if_exist:NT \l__problems_prob_min_tl {
7665       \bool_if:NT \c__problems_min_bool {
7666         \marginpar{\l__problems_prob_min_tl\ min}
7667         \addtocounter{min}{\l__problems_prob_min_tl}
7668       }
7669     }
7670   }
7671 }
7672 \</package>

```

(End definition for `\show@min`. This function is documented on page ??.)

Chapter 40

Implementation: The hwexam Class

The functionality is spread over the `hwexam` class and package. The class provides the `document` environment and pre-loads some convenience packages, whereas the package provides the concrete functionality.

40.1 Class Options

To initialize the `hwexam` class, we declare and process the necessary options by passing them to the respective packages and classes they come from.

```
7673 <@@=hwexam>
7674 <*cls>
7675 \ProvidesExplClass{hwexam}{2022/02/26}{3.0.1}{homework assignments and exams}
7676 \RequirePackage{l3keys2e}
7677 \DeclareOption*{
7678   \PassOptionsToClass{\CurrentOption}{document-structure}
7679   \PassOptionsToPackage{\CurrentOption}{stex}
7680   \PassOptionsToPackage{\CurrentOption}{hwexam}
7681   \PassOptionsToPackage{\CurrentOption}{tikzinput}
7682 }
7683 \ProcessOptions
```

We load `omdoc.cls`, and the desired packages. For the L^AT_EXML bindings, we make sure the right packages are loaded.

```
7684 \LoadClass{document-structure}
7685 \RequirePackage{stex}
7686 \RequirePackage{hwexam}
7687 \RequirePackage{tikzinput}
7688 \RequirePackage{graphicx}
7689 \RequirePackage{a4wide}
7690 \RequirePackage{amssymb}
7691 \RequirePackage{amstext}
7692 \RequirePackage{amsmath}
```

Finally, we register another keyword for the `document` environment. We give a default assignment type to prevent errors

```

7693 \newcommand\assig@default@type{\hwexam@assignment@kw}
7694 \def\document@hwexamtype{\assig@default@type}
7695 <@@=document_structure>
7696 \keys_define:nn { document-structure / document }{
7697 id .str_set_x:N = \c_document_structure_document_id_str,
7698 hwexamtype .tl_set:N = \document@hwexamtype
7699 }
7700 <@@=hwexam>
7701 </cls>

```

Chapter 41

Implementation: The hwexam Package

41.1 Package Options

The first step is to declare (a few) package options that handle whether certain information is printed or not. Some come with their own conditionals that are set by the options, the rest is just passed on to the `problems` package.

```
7702 \langle *package \rangle
7703 \ProvidesExplPackage{hwexam}{2022/02/26}{3.0.1}{homework assignments and exams}
7704 \RequirePackage{13keys2e}
7705
7706 \newif\iftest\testfalse
7707 \DeclareOption{test}{\testtrue}
7708 \newif\ifmultiple\multiplefalse
7709 \DeclareOption{multiple}{\multipletrue}
7710 \DeclareOption*{\PassOptionsToPackage{\CurrentOption}{problem}}
7711 \ProcessOptions
```

Then we make sure that the necessary packages are loaded (in the right versions).

```
7712 \RequirePackage{keyval}[1997/11/10]
7713 \RequirePackage{problem}
```

`\hwexam@*kw` For multilinguality, we define internal macros for keywords that can be specialized in `*.ldf` files.

```
7714 \newcommand\hwexam@assignment@kw{Assignment}
7715 \newcommand\hwexam@given@kw{Given}
7716 \newcommand\hwexam@due@kw{Due}
7717 \newcommand\hwexam@testemptypage@kw{This~page~was~intentionally~left~
7718 blank~for~extra~space}
7719 \def\hwexam@minutes@kw{minutes}
7720 \newcommand\correction@probs@kw{prob.}
7721 \newcommand\correction@pts@kw{total}
7722 \newcommand\correction@reached@kw{reached}
7723 \newcommand\correction@sum@kw{Sum}
7724 \newcommand\correction@grade@kw{grade}
7725 \newcommand\correction@forgrading@kw{To~be~used~for~grading,~do~not~write~here}
```

(End definition for \hwexam@*kw. This function is documented on page ??.)

For the other languages, we set up triggers

```

7726 \AddToHook{begindocument}{
7727 \ltx@ifpackageloaded{babel}{
7728 \makeatletter
7729 \clist_set:Nx \l_tmpa_clist {\bbl@loaded}
7730 \clist_if_in:NnT \l_tmpa_clist {ngerman}{
7731 \input{hwexam-ngerman.ldf}
7732 }
7733 \clist_if_in:NnT \l_tmpa_clist {finnish}{
7734 \input{hwexam-finnish.ldf}
7735 }
7736 \clist_if_in:NnT \l_tmpa_clist {french}{
7737 \input{hwexam-french.ldf}
7738 }
7739 \clist_if_in:NnT \l_tmpa_clist {russian}{
7740 \input{hwexam-russian.ldf}
7741 }
7742 \makeatother
7743 }{}
7744 }
7745

```

41.2 Assignments

Then we set up a counter for problems and make the problem counter inherited from `problem.sty` depend on it. Furthermore, we specialize the `\prob@label` macro to take the assignment counter into account.

```

7746 \newcounter{assignment}
7747 \numberproblemsin{assignment}
7748 \renewcommand\prob@label[1]{\assignment@number.#1}

```

We will prepare the keyval support for the `assignment` environment.

```

7749 \keys_define:nn { hwexam / assignment } {
7750 id .str_set:N = \l__hwexam_assign_id_str,
7751 number .int_set:N = \l__hwexam_assign_number_int,
7752 title .tl_set:N = \l__hwexam_assign_title_tl,
7753 type .tl_set:N = \l__hwexam_assign_type_tl,
7754 given .tl_set:N = \l__hwexam_assign_given_tl,
7755 due .tl_set:N = \l__hwexam_assign_due_tl,
7756 loadmodules .code:n = {
7757 \bool_set_true:N \l__hwexam_assign_loadmodules_bool
7758 }
7759 }
7760 \cs_new_protected:Nn \__hwexam_assignment_args:n {
7761 \str_clear:N \l__hwexam_assign_id_str
7762 \int_set:Nn \l__hwexam_assign_number_int {-1}
7763 \tl_clear:N \l__hwexam_assign_title_tl
7764 \tl_clear:N \l__hwexam_assign_type_tl
7765 \tl_clear:N \l__hwexam_assign_given_tl
7766 \tl_clear:N \l__hwexam_assign_due_tl
7767 \bool_set_false:N \l__hwexam_assign_loadmodules_bool

```

```

7768 \keys_set:nn { hwexam / assignment }{ #1 }
7769 }

```

The next three macros are intermediate functions that handle the case gracefully, where the respective token registers are undefined.

The `\given@due` macro prints information about the given and due status of the assignment. Its arguments specify the brackets.

```

7770 \newcommand\given@due[2]{
7771 \bool_lazy_all:nF {
7772 { \tl_if_empty_p:V \l__hwexam_inclasssign_given_tl }
7773 { \tl_if_empty_p:V \l__hwexam_assign_given_tl }
7774 { \tl_if_empty_p:V \l__hwexam_inclasssign_due_tl }
7775 { \tl_if_empty_p:V \l__hwexam_assign_due_tl }
7776 }{ #1 }
7777
7778 \tl_if_empty:NTF \l__hwexam_inclasssign_given_tl {
7779 \tl_if_empty:NF \l__hwexam_assign_given_tl {
7780 \hwexam@given@kw\xspace\l__hwexam_assign_given_tl
7781 }
7782 }{
7783 \hwexam@given@kw\xspace\l__hwexam_inclasssign_given_tl
7784 }
7785
7786 \bool_lazy_or:nnF {
7787 \bool_lazy_and_p:nn {
7788 \tl_if_empty_p:V \l__hwexam_inclasssign_due_tl
7789 }{
7790 \tl_if_empty_p:V \l__hwexam_assign_due_tl
7791 }
7792 }{
7793 \bool_lazy_and_p:nn {
7794 \tl_if_empty_p:V \l__hwexam_inclasssign_due_tl
7795 }{
7796 \tl_if_empty_p:V \l__hwexam_assign_due_tl
7797 }
7798 }{ ,~ }
7799
7800 \tl_if_empty:NTF \l__hwexam_inclasssign_due_tl {
7801 \tl_if_empty:NF \l__hwexam_assign_due_tl {
7802 \hwexam@due@kw\xspace \l__hwexam_assign_due_tl
7803 }
7804 }{
7805 \hwexam@due@kw\xspace \l__hwexam_inclasssign_due_tl
7806 }
7807
7808 \bool_lazy_all:nF {
7809 { \tl_if_empty_p:V \l__hwexam_inclasssign_given_tl }
7810 { \tl_if_empty_p:V \l__hwexam_assign_given_tl }
7811 { \tl_if_empty_p:V \l__hwexam_inclasssign_due_tl }
7812 { \tl_if_empty_p:V \l__hwexam_assign_due_tl }
7813 }{ #2 }
7814 }

```

`\assignment@title` This macro prints the title of an assignment, the local title is overwritten, if there is one

from the `\inputassignment`. `\assignment@title` takes three arguments the first is the fallback when no title is given at all, the second and third go around the title, if one is given.

```

7815 \newcommand\assignment@title[3]{
7816 \tl_if_empty:NTF \l__hwexam_inclasssign_title_tl {
7817 \tl_if_empty:NTF \l__hwexam_assign_title_tl {
7818 #1
7819 }{
7820 #2\l__hwexam_assign_title_tl#3
7821 }
7822 }{
7823 #2\l__hwexam_inclasssign_title_tl#3
7824 }
7825 }

```

(End definition for `\assignment@title`. This function is documented on page ??.)

`\assignment@number` Like `\assignment@title` only for the number, and no around part.

```

7826 \newcommand\assignment@number{
7827 \int_compare:nNnTF \l__hwexam_inclasssign_number_int = {-1} {
7828 \int_compare:nNnTF \l__hwexam_assign_number_int = {-1} {
7829 \arabic{assignment}
7830 } {
7831 \int_use:N \l__hwexam_assign_number_int
7832 }
7833 }{
7834 \int_use:N \l__hwexam_inclasssign_number_int
7835 }
7836 }

```

(End definition for `\assignment@number`. This function is documented on page ??.)

With them, we can define the central `assignment` environment. This has two forms (separated by `\ifmultiple`) in one we make a title block for an assignment sheet, and in the other we make a section heading and add it to the table of contents. We first define an assignment counter

`assignment` For the `assignment` environment we delegate the work to the `@assignment` environment that depends on whether `multiple` option is given.

```

7837 \newenvironment{assignment}[1][ ]{
7838 \__hwexam_assignment_args:n { #1 }
7839 %\sref@target
7840 \int_compare:nNnTF \l__hwexam_assign_number_int = {-1} {
7841 \global\stepcounter{assignment}
7842 }{
7843 \global\setcounter{assignment}{\int_use:N\l__hwexam_assign_number_int}
7844 }
7845 \setcounter{problem}{0}
7846 \def\current@section@level{\document@hwexamtype}
7847 %\sref@label@id{\document@hwexamtype \thesection}
7848 \begin{@assignment}
7849 }{
7850 \end{@assignment}
7851 }

```

In the multi-assignment case we just use the omdoc environment for suitable sectioning.

```

7852 \def\ass@title{
7853 \protect\document@hwexamtype~\arabic{assignment}
7854 \assignment@title{}\{;\}{} -- \given@due{}\}{}
7855 }
7856 \ifmultiple
7857 \newenvironment{@assignment}{
7858 \bool_if:NTF \l__hwexam_assign_loadmodules_bool {
7859 \begin{sfragment}[loadmodules]{\ass@title}
7860 }{
7861 \begin{sfragment}{\ass@title}
7862 }
7863 }{
7864 \end{sfragment}
7865 }

```

for the single-page case we make a title block from the same components.

```

7866 \else
7867 \newenvironment{@assignment}{
7868 \begin{center}\bf
7869 \Large@title\strut\
7870 \document@hwexamtype~\arabic{assignment}\assignment@title{}\{;\}{}{\}{}
7871 \large\given@due{--;\}{}{;\}{}
7872 \end{center}
7873 }{}
7874 \fi% multiple

```

41.3 Including Assignments

\in*assignment This macro is essentially a glorified `\include` statement, it just sets some internal macros first that overwrite the local points. Importantly, it resets the `inclassig` keys after the input.

```

7875 \keys_define:nn { hwexam / inclassignment } {
