2 Manual

2.1 Modules

{module}, {@module}

2.2 Semantic Macros and Notations

Semantic macros invoke a formally declared symbol.

To declare a symbol (in a module), we use \symdecl, which takes as argument the name of the corresponding semantic macro, e.g. \symdecl{foo} introduces the macro \foo. Additionally, \symdecl takes several options, the most important one being its arity. foo as declared above yields a *constant* symbol. To introduce an *operator* which takes arguments, we have to specify which arguments it takes.

For example, to introduce binary multiplication, we can do \symdecl[args=2]{mult}. We can then supply the semantic macro with arbitrarily many notations, such as \notation{mult}{#1 #2}.

Example 1

```
\symdec! [args=2] {mult}
\notation {mult} {#1 #2}
\nult {a} {b} $

ab
```

Since usually, a freshly introduced symbol also comes with a notation from the start, the \symdef command combines \symdecl and \notation. So instead of the above, we could have also written

```
\symdef[args=2]{mult}{#1 #2}
```

Adding more notations like $\notation[cdot]{mult}{#1 } or \\notation[times]{mult}{#1 } comp{\times} #2} allows us to write <math>\notation[cdot]{a}{b}$ and $\notation[times]{a}{b}$:

Example 2

```
| \notation[cdot]{\text{mult}}{\#1 \comp{\cdot} \#2} \notation[times]{\text{mult}}{\pmult}{\pmult} \text{comp}{\text{times}} \#2} \\ \mult[cdot]{\alpha}{\b}$ and $\mult[times]{\alpha}{\b}$
```

Not using an explicit option with a semantic macro yields the first declared notation, unless changed¹.

EdN:1

¹EdNote: TODO

Outside of math mode, or by using the starred variant \foo*, allows to provide a custom notation, where notational (or textual) components can be given explicitly in square brackets.

Example 3

```
a*b is the product of a and b
```

In custom mode, prefixing an argument with a star will not print that argument, but still export it to OMDoc:

Example 4

```
Multiplying again by b yields...
```

The syntax $*[\langle int \rangle]$ allows switching the order of arguments. For example, given a 2-ary semantic macro \forevery with exemplary notation \forall #1. #2, we can write

Example 5

```
\label{lem:comp} $$ \operatorname{grgs}=2]{ for every} $$ \operatorname{proposition $P$}[ \operatorname{holds for every} ]*[1]{ }x\in A$$
The proposition P holds for every x \in A
```

When using *[n], after reading the provided (nth) argument, the "argument counter" automatically continues where we left off, so the *[1] in the above example can be omitted.

For a macro with arity > 0, we can refer to the operator *itself* semantically by suffixing the semantic macro with an exclamation point! in either text or math mode.

Example 6

```
Multiplication (denoted by \cdot) is defined by..
```

4

The macro \comp as used everywhere above is responsible for highlighting, linking, and tooltips, and should be wrapped around the notation (or text) components that should be treated accordingly. While it is attractive to just wrap a whole notation, this would also wrap around e.g. the arguments themselves, so instead, the user is tasked with marking the notation components themself.

The precise behaviour of \comp is governed by the macro \@comp, which takes two arguments: The tex code of the text (unexpanded) to highlight, and the URI of the current symbol. \@comp can be safely redefined to customize the behaviour.

2.2.1 Other Argument Types

So far, we have stated the arity of a semantic macro directly. This works if we only have "normal" (or more precisely: i-type) arguments. To make use of other argument types, instead of providing the arity numerically, we can provide it as a sequence of characters representing the argument types – e.g. instead of writing args=2, we can equivalently write args=ii, indicating that the macro takes two i-type arguments.

Besides i-type arguments, STFX has two other types, which we will discuss now.

The first are *binding* (b-type) arguments, representing variables that are *bound* by the operator. This is the case for example in the above \forevery-macro: The first argument is not actually an argument that the forevery "function" is "applied" to; rather, the first argument is a new variable (e.g. x) that is *bound* in the subsequent argument. More accurately, the macro should therefore have been implemented thusly:

\symdef[args=bi]{forevery}{\forall #1.\; #2}

b-type arguments are indistinguishable from i-type arguments within STEX, but are treated very differently in OMDoc and by MMT. More interesting within STEX are a-type arguments, which represent (associative) arguments of flexible arity, which are provided as comma-separated lists. This allows e.g. better representing the \mult-macro above:

Example 7

As the example above shows, notations get a little more complicated for associative arguments. For every a-type argument, the \notation-macro takes an additional argument that declares how individual entries in an a-type argument list are aggregated. The first notation argument then describes how the aggregated expression is combined into the full representation.

For a more interesting example, consider a flexary operator for ordered sequences in ordered set, that taking arguments $\{a,b,c\}$ and \mathbb{R} prints $a \leq b \leq c \in \mathbb{R}$. This operator takes two arguments (an a-type argument and an i-type argument), aggregates the individuals of the associative argument using $\leq a$, and combines the result with a and the second argument thusly:

Example 8

```
a \leq b \leq c \in \mathbb{R}
```

.2 3 4

2.2.2Precedences

Every notation has an (upwards) operator precedence and for each argument a (downwards) argument precedence used for automated bracketing. For example, a notation for a binary operator \foo could be declared like this:

```
\notation[prec=200;500x600]{foo}{#1 \comp{+} #2}
```

assigning an operator precedence of 200, an argument precedence of 500 for the first argument, and an argument precedence of 600 for the second argument.

STFX insert brackets thusly: Upon encountering a semantic macro (such as \foo), its operator precedence (e.g. 200) is compared to the current downwards precedence (initially \neginfprec). If the operator precedence is smaller than the current downwards precedence, parentheses are inserted around the semantic macro.

Notations for symbols of arity 0 have a default precedence of \infprec, i.e. by default, parentheses are never inserted around constants. Notations for symbols with arity > 0 have a default operator precedence of 0. If no argument precedences are explicitly provided, then by default they are equal to the operator precedence.

Consequently, if some operator A should bind stronger than some operator B, then As operator precedence should be larger than Bs argument precedences.

For example:

Example 9

```
a+b\cdot c and a\cdot (b+c)
```

Archives and Imports 2.3

2.3.1 Namespaces

Ideally, STEX would use arbitrary URIs for modules, with no forced relationships between the logical namespace of a module and the physical location of the file declaring the module - like MMT does things.

 $^{^2\}mathrm{EdNote}\colon$ what about e.g. \int _x\int _y\int _z f dx dy dz?

 $^{^3\}mathrm{EdNote}\colon$ "decompose" a-type arguments into fixed-arity operators?

⁴EdNote: flexary b-type arguments (e.g. for forall)?

Unfortunately, TEX only provides very restricted access to the file system, so we are forced to generate namespaces systematically in such a way that they reflect the physical location of the associated files, so that STEX can resolve them accordingly. Largely, users need not concern themselves with namespaces at all, but for completenesses sake, we describe how they are constructed:

- If \begin{module}{Foo} occurs in a file /path/to/file/Foo[.\(\lang\)].tex which does not belong to an archive, the namespace is file://path/to/file.
- If the same statement occurs in a file /path/to/file/bar[. $\langle lang \rangle$].tex, the namespace is file://path/to/file/bar.

In other words: outside of archives, the namespace corresponds to the file URI with the filename dropped iff it is equal to the module name, and ignoring the (optional) language suffix¹.

If the current file is in an archive, the procedure is the same except that the initial segment of the file path up to the archive's source-folder is replaced by the archive's namespace URI.

2.3.2 Paths in Import-Statements

Conversely, here is how namespaces/URIs and file paths are computed in import statements, examplary \importmodule:

- \importmodule{Foo} outside of an archive refers to module Foo in the current namespace. Consequently, Foo must have been declared earlier in the same document or, if not, in a file Foo[.\lang\rangle].tex in the same directory.
- The same statement within an archive refers to either the module Foo declared earlier in the same document, or otherwise to the module Foo in the archive's top-level namespace. In the latter case, is has to be declared in a file Foo[. $\langle lang \rangle$].tex directly in the archive's source-folder.
- Similarly, in \importmodule{some/path?Foo} the path some/path refers to either the sub-directory and relative namespace path of the current directory and namespace outside of an archive, or relative to the current archive's top-level namespace and source-folder, respectively.
 - The module Foo must either be declared in the file $\langle top\text{-}directory \rangle$ /some/path/Foo[. $\langle lang \rangle$].tex, or in $\langle top\text{-}directory \rangle$ /some/path[. $\langle lang \rangle$].tex (which are checked in that order).
- Similarly, \importmodule[Some/Archive]{some/path?Foo} is resolved like the previous cases, but relative to the archive Some/Archive in the mathhub-directory.
- Finally, \importmodule{full://uri?Foo} naturally refers to the module Foo in the namespace full://uri. Since the file this module is declared in can not be determined directly from the URI, the module must be in memory already, e.g. by being referenced earlier in the same document.
 - Since this is less compatible with a modular development, using full URIs directly is discouraged.

¹which is internally attached to the module name instead, but a user need not worry about that.

3 Documentation

3.1 Utils

\sTeX both print this STEX logo. \stex \stex_debug:n $\stex_debug:n {\langle message \rangle}$ Logs $\langle message \rangle$, if the package option debug is used. \stex_kpsewhich:n \stex_kpsewhich:n executes kpsewhich and stores the return in \l_stex_kpsewhich_return_str. This does not require shell escaping. \stex_addtosms:n Adds the provided code to the .sms-file of the document. 3.1.1SCALATEXML and HTML Annotations \if@latexml LATEX2e and LATEX3 conditionals for LATEXML. \latexml_if_p: \latexml_if:T \latexml_if:F \latexml_if:TF We have four macros for annotating generated HTML (via LATEXML or SCALATEX) with attributes: $\verb|\stex_annotate:nnn| \{\langle property \rangle\} \ \{\langle resource \rangle\} \ \{\langle content \rangle\}$ \stex_annotate:nnn \stex_annotate_invisible:nnn \stex_annotate_invisible:n Annotates the HTML generated by $\langle content \rangle$ with property="stex: $\langle property \rangle$ ", resource=" $\langle resource \rangle$ ". \stex_annotate_invisible:n adds the attributes stex:visible="false", style="display:none". \stex_annotate_invisible:nnn combines the functionality of both. $\verb|\begin{stex_annotate_env}|{\langle property \rangle}|{\langle resource \rangle}|$ stex_annotate_env ⟨content⟩ \end{stex annotate env}

3.1.2 Languages

\c_stex_languages_prop
\c_stex_language_abbrevs_prop

Map language abbreviations to their full babel names and vice versa. e.g. \c_stex_languages_prop{en} yields english, and \c_stex_language_abbrevs_prop{english} yields en.

3.2 Files, Paths, URIs

 $\label{lem:lem:lem:nom_string:Nn} $$ \operatorname{stex_path_from_string:Nn} \ \langle path-variable \rangle \ \{\langle string \rangle\} $$ $$ \operatorname{stex_path_from_string:(NV|cn|cV)} $$$

turns the $\langle string \rangle$ into a path by splitting it at /-characters and stores the result in $\langle path-variable \rangle$. Also applies $\text{stex_path_canonicalize:N}$.

\stex_path_to_string:NN \stex_path_to_string:N

The inverse; turns a path into a string and stores it in the second argument variable, or leaves it in the input stream.

\stex_path_canonicalize:N

Canonicalizes the path provided; in particular, resolves . and \dots path segments.

\stex_path_if_absolute_p:N *\stex_path_if_absolute:NTF *

Checks whether the path provided is absolute, i.e. starts with an empty segment

\c_stex_pwd_seq
\c_stex_pwd_str
\c_stex_mainfile_seq

Store the current working directory as path-sequence and string, respectively, and the (heuristically guessed) full path to the main file, based on the PWD and \jobname.

 $\g_stex_currentfile_seq$

The file being currently processed (respecting \input etc.)

Test

path	canonicalized path	expected
aaa//aaa aaa/bbb aaa///aaa/bbb/aaa/bbb/aaa/bbb/aab/bbb//dbd aaa/bbb//ddd aaa/bbb//ddd ./ aaa/bbb//	aaa//aaa aaa/bbb//aaa/bbb/aba/bbb/aaa/bbb aaa/ddd aaa/bbb/ddd	aaa//aaa aaa/bbb//aaa/bbb/bbb/aaa/bbb aaa/ddd aaa/bbb/ddd

3.3 MathHub Archives

\mathhub
\c_stex_mathhub_seq
\c_stex_mathhub_str

We determine the path to the local MathHub folder via one of three means, in order of precedence:

- 1. The mathhub package option, or
- 2. the \mathhub-macro, if it has been defined before the \usepackage{stex}-statement, or
- 3. the MATHHUB system variable.

In all three cases, \c_stex_mathhub_seq and \c_stex_mathhub_str are set accordingly.

\l_stex_current_repository_prop

Always points to the *current* MathHub repository (if we currently are in one). Has the fields id, ns (namespace), narr (narrative namespace; currently not in use) and deps (dependencies; currently not in use).

\stex_set_current_repository:n

Sets the current repository to the one with the provided ID. calls __stex_mathhub_-do_manifest:n, so works whether this repository's MANIFEST.MF-file has already been read or not.

\stex_require_repository:n

Calls __stex_mathhub_do_manifest:n iff the corresponding archive property list does not already exist, and adds a corresponding definition to the .sms-file.

Test 2

```
\ExplSyntaxOn
\stex_require_repository:n { Foo/Bar }
id:~\prop_item:cn {c_stex_mathhub_Foo/Bar_manifest_prop} {id} \\
narr:-\prop_item:cn {c_stex_mathhub_Foo/Bar_manifest_prop} {narr} \\
ns:~\prop_item:cn {c_stex_mathhub_Foo/Bar_manifest_prop} {ns} \\
deps:~\prop_item:cn {c_stex_mathhub_Foo/Bar_manifest_prop} {deps} \\
\stext{deps:-\prop_item:cn {c_stex_mathhub_Foo/Bar_manifest_prop} {deps} \\
\stext{stex_require_repository:n { Bar/Foo }}
\ExplSyntaxOff
```

```
id: Foo/Bar
narr: http://mathhub.info/tests/Foo/Bar
ns: http://mathhub.info/tests/Foo/Bar
deps:
```

3.4 The Module System

\l_stex_current_module_prop

All information of a module is stored as a property list. \l_stex_current_module_prop always points to the current module (if existent).

Most importantly, the **content**-field stores all the code to execute on activation; i.e. when this module is being included.

Additionally, it stores:

- The name in field name,
- the namespace in field ns,
- this module's language in field lang,
- if a language module that translates some other modules, the *original* module in field sig (for signature),
- the metatheory in field meta,
- the URIs of all imported modules in field imports,
- the names of all declarations in field constants,
- the file this module was declared in in field file,

 $\stex_if_in_module_p: \star \\stex_if_in_module: TF \star$

Conditional for whether we are currently in a module

```
\stex_if_module_exists_p:n *\stex_if_module_exists:nTF *
```

Conditional for whether a module with the provided URI is already known.

\stex_add_to_current_module:n

Adds the provided tokens to the content field of the current module.

\stex_add_constant_to_current_module:n

Adds the declaration with the provided name to the constants field of the current module.

\stex_add_import_to_current_module:n

Adds the module with the provided full URI to the imports field of the current module.

> Computes the name space for file $\langle path \rangle$ in repository with name space $\langle namespace \rangle$ as follows:

If the file is .../source/sub/file.tex and the namespace http://some.namespace/foo, then the namespace of is http://some.namespace/foo/sub/file.

\stex_modules_current_namespace:

Computes the current namespace

Test 3

```
\ExplSyntaxOn
\stex_modules_current_namespace:
Namespace-1:\\ \l_stex_modules_ns_str \\
Faking-a-repository:\\
\stex_set_current_repository:n{Foo/Bar}
\seq_pop_right:NN \g_stex_currentfile_seq \testtemp
\edef\testtempb{\detokenize{source}}
\exp_args:NNo \seq_put_right:Nn \g_stex_currentfile_seq {\testtempb}
\exp_args:NNo \seq_put_right:Nn \g_stex_currentfile_seq {\testtempb}}
\stex_modules_current_namespace:
Namespace-2:\\ \l_stex_modules_ns_str
\ExplSyntaxOff
```

Namespace 1: file://home/jazzpirate/work/Software/ext/sTeX/sty/stex-master/stextest Faking a repository:
Namespace 2: http://mathhub.info/tests/Foo/Bar/test/stextest

.

3.4.1 The module-environment

module

\begin{module} $[\langle options \rangle] \{\langle name \rangle\}$ Opens a new module with name $\langle name \rangle$. TODO document options.

\stex_modules_heading:

Takes care of the module header, if the **showmods** package option is true. This macro can be overridden for customization.

@module

 $\label{lem:cond} $$ \operatorname{Core} \left(\operatorname{Cond}_{(name)}\right) $$ Core functionality of the module-environment without a header.$

Test 4

```
Module path: http://mathhub.info/tests/Foo/Bar?Foo
Language:
Signature:
Metatheory:
```

Test 5

```
\ExplSyntaxOn
\stex_set_current_repository:n {Foo/Bar}
\stex_debug:n{Test:-\stex_path_to_string:N \g stex_currentfile_seq }
\seq_pop_right:NN \g_stex_currentfile_seq \limbda_tl
\seq_put_right:Nx \g_stex_currentfile_seq \limbda_tl_to_str:n{Foo}}
\seq_put_right:Nx \g_stex_currentfile_seq \limbda_tl_to_str:n{Source}}
\seq_put_right:Nx \g_stex_currentfile_seq \limbda_tl_to_stex_currentfile_seq \limbda_tl_to_stex_currentfile_seq \limbda_tl_to_stex_currentfile_seq \limbda_tl_to_stex_currentfile_seq \limbda_tl_to_stex_currentfile_seq \limbda_tl_to_stex_currentfile_seq \limbda_tl_to_stex_current_module_prop \limbda_tl_to_stex_current_module_prop \limbda_tl_to_stex_current_module_prop \limbda_tl_to_stex_current_module_prop \limbda_tl_to_stex_current_module_prop \limbda_tl_to_stex_current_module_prop \limbda_tl_to_stex_current_tl_to_stex_current_module_prop \limbda_tl_to_stex_current_tl_to_stex_current_tl_to
```

Module 3.1[Bar] (FooBar)
Module path: http://mathhub.info/tests/Foo/Bar/Foo?Bar
Language:
Signature:
Metatheory:

3.4.2 SMS Mode

"SMS Mode" is used when loading modules from external tex files. It deactivates any output and ignores all TeX commands not explicitly allowed via the following lists:

\g_stex_smsmode_allowedmacros_tl

Macros that are executed as is; i.e. with the category code scheme used in SMS mode.

\g_stex_smsmode_allowedmacros_escape_tl

Macros that are executed with the category codes restored.

Importantly, these macros need to call \stex_smsmode_set_codes: after reading all arguments. Note, that \stex_smsmode_set_codes: takes care of checking whether we are in SMS mode in the first place, so calling this function eagerly is unproblematic.

\g_stex_smsmode_allowedenvs_seq

The names of environments that should be allowed in SMS mode. The corresponding \begin-statements are treated like the macros in \g_stex_smsmode_allowedmacros_-escape_tl, so \stex_smsmode_set_codes: should be called at the end of the \begin-code. Since \end-statements take no arguments anyway, those are called with the SMS mode category code scheme active.

\stex_if_smsmode_p: *
\stex_if_smsmode:TF *

Tests whether SMS mode is currently active.

\stex_smsmode_set_codes:

Sets the current category code scheme to that of the SMS mode, if SMS mode is currently active and if necessary.

This method should be called at the end of every macro or **\begin** environment code that are allowed in SMS mode.

\stex_in_smsmode:nn

 $\sum_{n=0}^{\infty} {\langle name \rangle} {\langle code \rangle}$

Executes $\langle code \rangle$ in SMS mode. $\langle name \rangle$ can be arbitrary, but should be distinct, since it allows for nesting $\sl ex_in_smsmode:nn$ without spuriously terminating SMS mode.

Test 6

```
\immediate\openout\testfile=./tests/sometest.tex
\immediate\write\testfile{\detokenize{\this is \a test}^^J}
\immediate\write\testfile{\detokenize{this \is a \test}}
\immediate\closeout\testfile
\ExplSyntaxOn
\stex_in_smmode:nn { foo } {
\input{tests/sometest.tex}}
}
\ExplSyntaxOff
```

3.4.3 Imports and Inheritance

\importmodule

 $\verb|\importmodule[|\langle archive-ID\rangle]| = \{|\langle module-path\rangle|\}$

Imports a module by reading it from a file and "activating" it. STEX determines the module and its containing file by passing its arguments on to \stex_import_module_-path:nn.

Test 7

```
\begin{module}{Foo}
\symdecl[name=foo, args=3]{bar}
\symdecl[args=bai]{foobar}

Meaning:-\present\bar\\
\end{module}

Meaning:-\present\bar\\
\begin{module}{Importtest}
\importmodule{Foo}

Meaning:-\present\bar\\
\end{module}{Importest}
\importmodule{Foo}

Meaning:-\present\bar\\
\end{module}
```

```
Module 3.2[Foo]

Meaning: >macro:->\stex_invoke_symbol:n {file://home/jazzpirate/work/Software/ext/sTeX/sty/stex-master/stextest?Foo?foc}

Meaning: >macro:->\protect \bar «

Module 3.3[Importtest]

Meaning: >macro:->\stex_invoke_symbol:n {file://home/jazzpirate/work/Software/ext/sTeX/sty/stex-master/stextest?Foo?foc}
```

\usemodule

 $\verb|\importmodule[|\langle archive-ID\rangle]| = \{|\langle module-path\rangle|\}$

Like \importmodule, but does not export its contents; i.e. including the current module will not activate the used module

\stex_import_module_uri:nn

 $\stex_import_module_uri:nn {\langle archive-ID \rangle} {\langle module-path \rangle}$

Determines the URI of a module by splitting $\langle module\text{-}path \rangle$ into $\langle path \rangle$? $\langle name \rangle$. If $\langle module\text{-}path \rangle$ does not contain a ?-character, we consider it to be the $\langle name \rangle$, and $\langle path \rangle$ to be empty.

If $\langle archive\text{-}ID \rangle$ is empty, it is automatically set to the ID of the current archive (if one exists).

1. If $\langle archive\text{-}ID \rangle$ is empty:

- (a) If $\langle path \rangle$ is empty, then $\langle name \rangle$ must have been declared earlier in the same file and retrievable from $\g_stex_modules_in_file_seq$, or a file with name $\langle name \rangle . \langle lang \rangle$. tex must exist in the same folder, containing a module $\langle name \rangle$. That module should have the same namespace as the current one.
- (b) If $\langle path \rangle$ is not empty, it must point to the relative path of the containing file as well as the namespace.

2. Otherwise:

(a) If $\langle path \rangle$ is empty, then $\langle name \rangle$ must have been declared earlier in the same file and retrievable from $\g_stex_modules_in_file_seq$, or a file with name $\langle name \rangle . \langle lang \rangle . tex$ must exist in the top source folder of the archive, containing a module $\langle name \rangle .$

That module should lie directly in the namespace of the archive.

(b) If $\langle path \rangle$ is not empty, it must point to the path of the containing file as well as the namespace, relative to the namespace of the archive.

If a module by that namespace exists, it is returned. Otherwise, we call \stex_require_module:nn on the source directory of the archive to find the file.

Checks whether a module with URI $\langle ns \rangle$? $\langle name \rangle$ already exists. If not, it looks for a plausible file that declares a module with that URI.

Finally, activates that module by executing its content-field.

\g_stex_module_files_prop \g_stex_modules_in_file_seq

A property list mapping file paths to the lists of all modules declared therein. \g_stex_-modules_in_file_seq always points to the current file(-stream - \inputs are considered the same file).

3.5 Symbols and Terms

\symdecl

 $\symdecl[\langle args \rangle] \{\langle macroname \rangle\}$

Declares a new symbol with semantic macro \macroname. Optional arguments are:

- name: An (OMDoc) name. By default equal to $\langle macroname \rangle$.
- type: An (ideally semantic) term. Not used by STEX, but passed on to MMT for semantic services.
- local: A boolean (by default false). If set, this declaration will not be added to the module content, i.e. importing the current module will not make this declaration available.
- args: Specifies the "signature" of the semantic macro. Can be either an integer $0 \le n \le 9$, or a (more precise) sequence of the following characters:
 - i a "normal" argument, e.g. \symdecl[args=ii]{plus} allows for \plus{2}{2}.
 - a an associative argument; i.e. a sequence of arbitrarily many arguments provided as a comma-separated list, e.g. \symdecl[args=a]{plus} allows for \plus{2,2,2}.
 - b a variable argument. Is treated by STEX like an i-argument, but an application is turned into an OMBind in OMDoc, binding the provided variable in the subsequent arguments of the operator; e.g. \symdecl[args=bi]{forall} allows for \forall{x\in\Nat}{x\geq0}.

\abbrdef

 $\abbrdef[\langle args \rangle] \{\langle macroname \rangle\} \{\langle term \rangle\}$

\abbrdef behaves like **\symdecl**, but adds the definiens $\langle term \rangle$ to the symbol. The latter is largely ignored and irrelevant to STEX, but exported to OMDoc.

\stex_symdecl_do:n

Implements the core functionality of \symdecl, and is called by \symdecl, \symdef and \abbrdef.

Ultimately stores the symbol $\langle \mathit{URI} \rangle$ in the property list \g_stex_symdecl_ $\langle \mathit{URI} \rangle$ _prop with fields:

- name (string),
- module (string),
- notations (sequence of strings; initially empty),
- local (boolean),
- type (token list),
- args (string of is, as and bs),
- arity (integer string),
- assocs (integer string; number of associative arguments),

Test 8

```
\begin{module}{SymdeclTest}
\symdecl[name=foo, args=3]{bar}
\symdecl[name=foobar, args=iab]{bari}

```

Module 3.4[SymdeclTest]

Meaning: >macro:->\stex_invoke_symbol:n {file://home/jazzpirate/work/Software/ext/sTeX/sty/stex-master/stextest?SymdeclTest?foo}

Result: file://home/jazzpirate/work/Software/ext/sTeX/sty/stex-master/stextest?SymdeclTest?foo

Meaning: >macro:->\stex_invoke_symbol:n {file://home/jazzpirate/work/Software/ext/sTeX/sty/stex-master/stextest?SymdeclTest?bardef) <

\stex_get_symbol:n

Computes the full URI of a symbol from a macro argument, e.g. the macro name, the macro itself, the full URI...

\stex_invoke_symbol:n

Executes a semantic macro. Outside of math mode or if followed by *, it continues to \stex_term_custom:nn. In math mode, it uses the default or optionally provided notation of the associated symbol.

If followed by !, it will invoke the symbol *itself* rather than its application (and continue to \stex_term_custom:nn), i.e. it allows to refer to \plus![addition] as an operation, rather than \plus[addition of]{some}{terms}.

\notation

 $\notation[\langle args \rangle] \{\langle symbol \rangle\} \{\langle notations^+ \rangle\}$

Introduces a new notation for $\langle symbol \rangle$, see \stex_notation_do:nn

\stex_notation_do:nn

 $\verb|\stex_notation_do:nn{|\langle \mathit{URI} \rangle \}} {\langle \mathit{notations}^+ \rangle }$

Implements the core functionality of \notation, and is called by \notation and \symdef.

Ultimately stores the notation in the property list $\gsin variant = \sqrt{URI} + \sqrt{variant} + \sqrt{ung} - v$ with fields:

- symbol (URI string),
- language (string),
- variant (string),
- opprec (integer string),
- argprecs (sequence of integer strings)

Test 9

Module 3.5[NotationTest]

\symdef

 $\symdef[\langle args \rangle] \{\langle symbol \rangle\} \{\langle notations^+ \rangle\}$

Combines \symdecl and \notation by introducing a new symbol and assigning a new notation for it.

Test 10

```
\begin{module}{SymdefTest}
\symdef[args=a, prec=50]{plus}{ #1 }{#1 \comp+ #2}
$\plus{a,b,c}$
\end{module}
```

Module 3.6[SymdefTest] a+b+c

_stex_term_math_oms:nnnn _stex_term_math_oma:nnnn _stex_term_math_omb:nnnn $\langle \mathit{URI} \rangle \langle \mathit{fragment} \rangle \langle \mathit{precedence} \rangle \langle \mathit{body} \rangle$

Annotates $\langle body \rangle$ as an OMDoc-term (OMID, OMA or OMBIND, respectively) with head symbol $\langle URI \rangle$, generated by the specific notation $\langle fragment \rangle$ with (upwards) operator precedence $\langle precedence \rangle$. Inserts parentheses according to the current downwards precedence and operator precedence.

 $\stex_term_arg:nnn\langle int\rangle\langle prec\rangle\langle body\rangle$

Annotates $\langle body \rangle$ as the $\langle int \rangle$ th argument of the current OMA or OMBIND, with (downwards) argument precedence $\langle prec \rangle$.

 $\verb|\stex_term_math_assoc_arg:nnnn| \verb|\stex_term_arg:nnn| \langle int \rangle \langle prec \rangle \langle notation \rangle \langle body \rangle$

Annotates $\langle body \rangle$ as the $\langle int \rangle$ th (associative) sequence argument (as comma-separated list of terms) of the current OMA or OMBIND, with (downwards) argument precedence $\langle prec \rangle$ and associative notation $\langle notation \rangle$.

\infprec \neginfprec

Maximal and minimal notation precedences.

\STEXdobrackets

\STEXdobrackets $\{\langle body \rangle\}$

Puts $\langle body \rangle$ in parentheses; scaled if in display mode unscaled otherwise. Uses the current STEX brackets (by default (and)), which can be changed temporarily using \STEXwithbrackets.

\STEXwithbrackets

 $\verb|\STEXwithbrackets| \langle \textit{left} \rangle | \langle \textit{right} \rangle | \{\langle \textit{body} \rangle\}|$

Temporarily (i.e. within $\langle body \rangle$) sets the brackets used by STEX for automated bracketing (by default (and)) to $\langle left \rangle$ and $\langle right \rangle$.

Note that $\langle \mathit{left} \rangle$ and $\langle \mathit{right} \rangle$ need to be allowed after \left and \right in displaymode.

Test 11

```
\begin{module}{MathTest1}
\importmodule{Foo}
\notation[foo, prec=500;20x20x20]{bar}{\comp\langle {#1 ^ {#2}}_{#3} \comp\rangle }
$\bar abc$ and $\bar[foo] abc$.
\end{module}
```

```
Module 3.7[MathTest1] \langle a^b{}_c \rangle \text{ and } \langle a^b{}_c \rangle.
```

Test 12

```
\begin{module}{MathTest2}
\importmodule{Foo}
\notation[foo, prec=500;20x20x20x20]{foobar}{\comp\langle #1 \comp\mid [ #2 ]^{#3} \comp\rangle }{ {#1}_{\comp}\rangle }{ {*1}_{\comp}\rangle }{ {*1}_{\comp
```

```
\begin{aligned} & \textbf{Module 3.8}[\text{MathTest2}] \\ & \langle a | [b:c;d:e:f]^g \rangle \text{ and } \langle a | [b:c]^g \rangle \text{ and } \langle a | [b]^c \rangle \\ & a+b\cdot c \text{ and } a \cdot (\frac{a}{b} + \frac{a}{c}) \end{aligned}
a+b\cdot c \text{ and } a \cdot \left(\frac{a}{b} + \frac{a}{c}\right)
a+b\cdot c \text{ and } a \cdot \left[\frac{a}{b} + \frac{a}{c}\right]
```

\stex_term_custom:nn

 $\verb|\stex_term_custom:nn{\langle \mathit{URI} \rangle} {\langle \mathit{args} \rangle}|$

Implements custom one-time notation. Invoked by $\stex:invoke_symbol:n$ in text mode, or if followed by * in math mode, or whenever followed by !.

Test 13

```
\begin{module}{TextTest}
\importmodule{Foo}
\bar[some ]a[ and some ]b[ and also some ]c[ here].
$\bar*[\text{some }]a[\text{ and some }]b[\text{ and also some }]c[\text{ here}]$.
$\bar*[\mathtt{bar}]$
\bar*{a}*{b}[or just some ]c
\bar![bar]
\bar[or first ]*[2]{b}[, then ]*[3]{c}[, and finally ]a
\end{module}
```

```
Module 3.9[TextTest]
some a and some b and also some c here.
some a and some b and also some c here.
bar
or just some c
bar
or first b, then c, and finally a
```

\stex_highlight_term:nn

 $\stex_highlight_term:nn{\langle \mathit{URI} \rangle}{\langle \mathit{args} \rangle}$

Establishes a context for \comp. Stores the URI in a variable so that \comp knows which symbol governs the current notation.

\comp

 $\comp{\langle args \rangle}$

Marks $\langle args \rangle$ as a notation component of the current symbol for highlighting, linking, etc.

The precise behavior is governed by \@comp, which takes as additional argument the URI of the current symbol. By default, \@comp adds the URI as a PDF tooltip and colors the highlighted part in blue.

4 Implementation

4.1 The STEX document class

```
1  \langle \cdot \c
```

4.2 Preliminaries

```

(End definition for \__stex_annotate_checkempty:n.)
```

\stex_annotate:nnx \stex_annotate_invisible:nn \stex_annotate_invisible:nnn We define four macros for introducing attributes in the HTML output. The definitions depend on the "backend" used (LATEXML, SCALATEX, pdflatex).

The pdflatex-macros largely do nothing; the SCALATEX-implementations are pretty clear in what they do, the LATEXML-implementations resort to perl bindings.

4.2.3 Languages

```
173 (@@=stex_language)
```

```
\c_stex_languages_prop
\c_stex_language_abbrevs_prop
```

We store language abbreviations in two (mutually inverse) property lists:

```
174 \prop_const_from_keyval:Nn \c_stex_languages_prop {
175    en = english ,
176    de = ngerman ,
```

```
ar = arabic,
177
    bg = bulgarian
178
    ru = russian ,
179
    fi = finnish ,
180
    ro = romanian ,
181
     tr = turkish ,
182
     fr = french
183
184 }
185
   \prop_const_from_keyval:Nn \c_stex_language_abbrevs_prop {
186
187
     english
                = en ,
                = de ,
188
     ngerman
                = ar ,
     arabic
189
     bulgarian = bg ,
190
     russian
191
                = ru .
     finnish
                = fi,
192
     romanian
                = ro ,
193
     turkish
                = tr ,
194
     french
                = fr
197 % todo: chinese simplified (zhs)
198 %
           chinese traditional (zht)
```

 $(End\ definition\ for\ \c_stex_languages_prop\ \ and\ \c_stex_language_abbrevs_prop.\ \ These\ variables\ are\ documented\ on\ page\ {\it 9.})$

we use the lang-package option to load the corresponding babel languages:

```
\clist_if_empty:NF \c_stex_languages_clist {

4.3.3 File Hooks and Tracking

```
305 (@@=stex_files)
```

We introduce hooks for file inputs that keep track of the absolute paths of files used. This will be useful to keep track of modules, their archives, namespaces etc.

Note that the absolute paths are only accurate in \input-statements for paths relative to the PWD, so they shouldn't be relied upon in any other setting than for STEX-purposes.

\g_stex_files_stack

\c stex mainfile sea

keeps track of file changes

```
306 \seq_gclear_new:N\g__stex_files_stack
(End definition for \g__stex_files_stack.)

307 \stex_path_from_string:Nn \c_stex_mainfile_seq {
308 \c_stex_pwd_str/\g_file_curr_name_str.tex
```

(End definition for \c_stex_mainfile_seq. This variable is documented on page 9.)

\g_stex_currentfile_seq

Hooks for file inputs that push/pop $\g_stex_files_stack$ to update $\c_stex_mainfile seq.$

```
310 \seq_gclear_new: N\g_stex_currentfile_seq
   \AddToHook{file/before}{
312
     \stex_path_from_string:Nn\g_stex_currentfile_seq{\CurrentFilePath}
