2 Manual

2.1 Notations and Precedences

Every notation has an (upwards) operator precedence and for each argument a (downwards) argument precedence used for automated bracketing. For example, a notation for a binary operator \foo could be declared like this:

$$\noindent [prec=200;500x600]{foo}{#1 + #2}$$

assigning an operator precedence of 200, an argument precedence of 500 for the first argument, and an argument precedence of 600 for the second argument.

SIEX insert brackets thusly: Upon encountering a semantic macro (such as \foo), its operator precedence (e.g. 200) is compared to the current downwards precedence (initially \neginfprec). If the operator precedence is *smaller* than the current downwards precedence, parentheses are inserted around the semantic macro.

Notations for symbols of arity 0 have a default precedence of \infprec, i.e. by default, parentheses are never inserted around constants. Notations for symbols with arity > 0 have a default operator precedence of 0. If no argument precedences are explicitly provided, then by default they are equal to the operator precedence.

Consequently, if some operator A should bind stronger than some operator B, then As operator precedence should be larger than Bs argument precedences.

For example, we could set

$$\notation[prec=50]{plus}{\#1 + \#2}$$

and

then $\alpha_{a}{\sigma}$ would yield $a+b\cdot c$, and $\tau_{a}{\phi}$ would yield $a\cdot (b+c)$.

2.2 Archives and Imports

2.2.1 Namespaces

Ideally, STEX would use arbitrary URIs for modules, with no forced relationships between the *logical* namespace of a module and the *physical* location of the file declaring the module – like MMT does things.

Unfortunately, TEX only provides very restricted access to the file system, so we are forced to generate namespaces systematically in such a way that they reflect the physical location of the associated files, so that STEX can resolve them accordingly. Largely, users need not concern themselves with namespaces at all, but for completenesses sake, we describe how they are constructed:

- If \begin{module}{Foo} occurs in a file /path/to/file/Foo[.\(\lang\)].tex which does not belong to an archive, the namespace is file://path/to/file.
- If the same statement occurs in a file /path/to/file/bar[.\(\lang\)].tex, the namespace is file://path/to/file/bar.

In other words: outside of archives, the namespace corresponds to the file URI with the filename dropped iff it is equal to the module name, and ignoring the (optional) language suffix¹.

If the current file is in an archive, the procedure is the same except that the initial segment of the file path up to the archive's source-folder is replaced by the archive's namespace URI.

2.2.2 Paths in Import-Statements

Conversely, here is how namespaces/URIs and file paths are computed in import statements, examplary \importmodule:

- \importmodule{Foo} outside of an archive refers to module Foo in the current namespace. Consequently, Foo must have been declared earlier in the same document or, if not, in a file Foo[. $\langle lanq \rangle$].tex in the same directory.
- The same statement within an archive refers to either the module Foo declared earlier in the same document, or otherwise to the module Foo in the archive's top-level namespace. In the latter case, is has to be declared in a file Foo[. $\langle lang \rangle$].tex directly in the archive's source-folder.
- Similarly, in \importmodule{some/path?Foo} the path some/path refers to either the sub-directory and relative namespace path of the current directory and namespace outside of an archive, or relative to the current archive's top-level namespace and source-folder, respectively.
 - The module Foo must either be declared in the file $\langle top\text{-}directory \rangle$ /some/path/Foo[. $\langle lang \rangle$].tex, or in $\langle top\text{-}directory \rangle$ /some/path[. $\langle lang \rangle$].tex (which are checked in that order).
- Similarly, \importmodule[Some/Archive]{some/path?Foo} is resolved like the previous cases, but relative to the archive Some/Archive in the mathhub-directory.
- Finally, \importmodule{full://uri?Foo} naturally refers to the module Foo in the namespace full://uri. Since the file this module is declared in can not be determined directly from the URI, the module must be in memory already, e.g. by being referenced earlier in the same document.
 - Since this is less compatible with a modular development, using full URIs directly is discouraged.

3 Documentation

3.1 Utils

\sTeX both print this STEX logo.

\stex_debug:n

\stex_debug:n {\message\}

Logs $\langle message \rangle$, if the package option debug is used.

¹which is internally attached to the module name instead, but a user need not worry about that.

\stex_kpsewhich:n

\stex_kpsewhich:n executes kpsewhich and stores the return in \l_stex_kpsewhich_return_str. This does not require shell escaping.

\stex_addtosms:n

Adds the provided code to the .sms-file of the document.

3.1.1 SCALATEXML and HTML Annotations

\if@latexml if

LATEX7 and LATEX aconditionals for LATEXML.

\latexml_if_p:
\latexml_if:T
\latexml_if:F
\latexml_if:TF

We have four macros for annotating generated HTML (via LATEXML or SCALATEX) with attributes:

\stex_annotate:nnn \s \stex_annotate_invisible:nnn \stex_annotate_invisible:n

 $\verb|\stex_annotate:nnn| \{\langle property \rangle\} \ \{\langle resource \rangle\} \ \{\langle content \rangle\}$

Annotates the HTML generated by $\langle \mathit{content} \rangle$ with

 $\verb|property="stex:\langle property\rangle| \verb|", resource="\langle resource\rangle| \verb|".$

\stex_annotate_invisible:n adds the attributes

stex:visible="false", style="display:none".

\stex_annotate_invisible:nnn combines the functionality of both.

stex_annotate_env

 $\label{lem:content} $$ \content \ \content \ \content \ \end{sex_annotate_env} $$ \end{sex_annotate_env} $$ \end{sex_annotate_env} $$ \end{sex_annotate_env} $$ \end{sex_annotate_env} $$ \end{sex_annotate_env} $$ \content \end{sex_annotate_env} $$ \end{sex_annotate_env}.$

3.1.2 Languages

\c_stex_languages_prop
\c_stex_language_abbrevs_prop

Map language abbreviations to their full babel names and vice versa. e.g. \c_stex_languages_prop{en} yields english, and \c_stex_language_abbrevs_prop{english} yields en.

3.2 Files, Paths, URIs

turns the $\langle string \rangle$ into a path by splitting it at /-characters and stores the result in $\langle path\text{-}variable \rangle$. Also applies \stex_path_canonicalize:N.

\stex_path_to_string:NN \stex_path_to_string:N The inverse; turns a path into a string and stores it in the second argument variable, or leaves it in the input stream.

\stex_path_canonicalize:N

Canonicalizes the path provided; in particular, resolves . and .. path segments.

 $\stex_path_if_absolute_p:N \star \\stex_path_if_absolute:NTF \star$

Checks whether the path provided is absolute, i.e. starts with an empty segment

\c_stex_pwd_seq
\c_stex_pwd_str
\c_stex_mainfile_seq

Store the current working directory as path-sequence and string, respectively, and the (heuristically guessed) full path to the main file, based on the PWD and \jobname.

 $\g_stex_currentfile_seq$

The file being currently processed (respecting \input etc.)

3.3 MathHub Archives

\mathhub \c_stex_mathhub_seq \c_stex_mathhub_str

We determine the path to the local MathHub folder via one of three means, in order of precedence:

- 1. The mathhub package option, or
- 2. the \mathhub-macro, if it has been defined before the \usepackage{stex}-statement, or
- 3. the MATHHUB system variable.

In all three cases, \c_stex_mathhub_seq and \c_stex_mathhub_str are set accordingly.

\l_stex_current_repository_prop

Always points to the *current* MathHub repository (if we currently are in one). Has the fields id, ns (namespace), narr (narrative namespace; currently not in use) and deps (dependencies; currently not in use).

\stex_set_current_repository:n

Sets the current repository to the one with the provided ID. calls __stex_mathhub_-do_manifest:n, so works whether this repository's MANIFEST.MF-file has already been read or not.

\stex_require_repository:n

Calls __stex_mathhub_do_manifest:n iff the corresponding archive property list does not already exist, and adds a corresponding definition to the .sms-file.

3.4 The Module System

\l_stex_current_module_prop

All information of a module is stored as a property list. \l_stex_current_module_prop always points to the current module (if existent).

Most importantly, the **content**-field stores all the code to execute on activation; i.e. when this module is being included.

Additionally, it stores:

- The name in field name,
- the *namespace* in field ns,
- this module's language in field lang,
- if a language module that translates some other modules, the *original* module in field sig (for signature),
- the metatheory in field meta,
- the URIs of all imported modules in field imports,
- the names of all declarations in field constants,
- the file this module was declared in in field file,

\stex_if_in_module_p: *
\stex_if_in_module: TF *

Conditional for whether we are currently in a module

_ _ _ _

 $\stex_if_module_exists_p:n *$

 $\stex_if_module_exists:n_{\overline{TF}} \star$

Conditional for whether a module with the provided URI is already known.

\stex_add_to_current_module:n

Adds the provided tokens to the content field of the current module.

\stex_add_constant_to_current_module:n

Adds the declaration with the provided name to the constants field of the current module.

\stex_add_import_to_current_module:n

Adds the module with the provided full URI to the imports field of the current module.

Computes the namespace for file $\langle path \rangle$ in repository with namespace $\langle namespace \rangle$ as follows:

If the file is .../source/sub/file.tex and the namespace http://some.namespace/foo, then the namespace of is http://some.namespace/foo/sub/file.

\stex_modules_current_namespace:

Computes the current namespace

3.4.1 The module-environment

module

\begin{module} $[\langle options \rangle] \{\langle name \rangle\}$ Opens a new module with name $\langle name \rangle$.
TODO document options.

\stex_modules_heading:

Takes care of the module header, if the **showmods** package option is true. This macro can be overridden for customization.

@module

 $\begin{Cond} \end{Cond} \cite{Cond} \cit$

3.4.2 SMS Mode

"SMS Mode" is used when loading modules from external tex files. It deactivates any output and ignores all TeX commands not explicitly allowed via the following lists:

\g_stex_smsmode_allowedmacros_tl

Macros that are executed as is; i.e. with the category code scheme used in SMS mode.

\g_stex_smsmode_allowedmacros_escape_tl

Macros that are executed with the category codes restored.

Importantly, these macros need to call \stex_smsmode_set_codes: after reading all arguments. Note, that \stex_smsmode_set_codes: takes care of checking whether we are in SMS mode in the first place, so calling this function eagerly is unproblematic.

\g_stex_smsmode_allowedenvs_seq

The names of environments that should be allowed in SMS mode. The corresponding \begin-statements are treated like the macros in \g_stex_smsmode_allowedmacros_-escape_tl, so \stex_smsmode_set_codes: should be called at the end of the \begin-code. Since \end-statements take no arguments anyway, those are called with the SMS mode category code scheme active.

\stex_if_smsmode_p: *
\stex_if_smsmode: TF *

Tests whether SMS mode is currently active.

\stex_smsmode_set_codes:

Sets the current category code scheme to that of the SMS mode, if SMS mode is currently active and if necessary.

This method should be called at the end of every macro or **\begin** environment code that are allowed in SMS mode.

\stex_in_smsmode:nn

 $\star \cdot \{\langle name \rangle\}$

Executes $\langle code \rangle$ in SMS mode. $\langle name \rangle$ can be arbitrary, but should be distinct, since it allows for nesting $\text{stex_in_smsmode:nn}$ without spuriously terminating SMS mode.

3.4.3 Imports and Inheritance

\importmodule

 $\in \protection [(archive-ID)] {(module-path)}$

Imports a module by reading it from a file and "activating" it. STEX determines the module and its containing file by passing its arguments on to \stex_import_module_-path:nn.

\usemodule

 $\verb|\importmodule[$\langle$archive-ID$\rangle]{\langlemodule-path\rangle}$$

Like \importmodule, but does not export its contents; i.e. including the current module will not activate the used module

\stex_import_module_uri:nn

 $\stex_import_module_uri:nn \{\langle archive-ID \rangle\} \{\langle module-path \rangle\}$

Determines the URI of a module by splitting $\langle module\text{-}path \rangle$ into $\langle path \rangle$? $\langle name \rangle$. If $\langle module\text{-}path \rangle$ does not contain a ?-character, we consider it to be the $\langle name \rangle$, and $\langle path \rangle$ to be empty.

If $\langle archive\text{-}ID \rangle$ is empty, it is automatically set to the ID of the current archive (if one exists).

1. If $\langle archive\text{-}ID \rangle$ is empty:

- (a) If $\langle path \rangle$ is empty, then $\langle name \rangle$ must have been declared earlier in the same file and retrievable from $\g_stex_modules_in_file_seq$, or a file with name $\langle name \rangle . \langle lang \rangle$. tex must exist in the same folder, containing a module $\langle name \rangle$. That module should have the same namespace as the current one.
- (b) If $\langle path \rangle$ is not empty, it must point to the relative path of the containing file as well as the namespace.

2. Otherwise:

(a) If $\langle path \rangle$ is empty, then $\langle name \rangle$ must have been declared earlier in the same file and retrievable from $\g_stex_modules_in_file_seq$, or a file with name $\langle name \rangle . \langle lang \rangle . tex$ must exist in the top source folder of the archive, containing a module $\langle name \rangle$.

That module should lie directly in the namespace of the archive.

(b) If $\langle path \rangle$ is not empty, it must point to the path of the containing file as well as the namespace, relative to the namespace of the archive.

If a module by that namespace exists, it is returned. Otherwise, we call \stex_require_module:nn on the source directory of the archive to find the file.

Checks whether a module with URI $\langle ns \rangle$? $\langle name \rangle$ already exists. If not, it looks for a plausible file that declares a module with that URI.

Finally, activates that module by executing its content-field.

\g_stex_module_files_prop \g_stex_modules_in_file_seq

A property list mapping file paths to the lists of all modules declared therein. \g_stex_-modules_in_file_seq always points to the current file(-stream - \inputs are considered the same file).

3.5 Symbols and Terms

\symdecl

 $\symdecl[\langle args \rangle] \{\langle macroname \rangle\}$

Declares a new symbol with semantic macro \macroname. Optional arguments are:

- name: An (OMDoc) name. By default equal to $\langle macroname \rangle$.
- type: An (ideally semantic) term. Not used by STEX, but passed on to MMT for semantic services.
- local: A boolean (by default false). If set, this declaration will not be added to the module content, i.e. importing the current module will not make this declaration available.
- args: Specifies the "signature" of the semantic macro. Can be either an integer $0 \le n \le 9$, or a (more precise) sequence of the following characters:
 - i a "normal" argument, e.g. \symdecl[args=ii]{plus} allows for \plus{2}{2}.
 - a an associative argument; i.e. a sequence of arbitrarily many arguments provided as a comma-separated list, e.g. \symdecl[args=a]{plus} allows for \plus{2,2,2}.
 - b a variable argument. Is treated by STEX like an i-argument, but an application is turned into an OMBind in OMDoc, binding the provided variable in the subsequent arguments of the operator; e.g. \symdecl[args=bi]{forall} allows for \forall{x\in\Nat}{x\geq0}.

\stex_symdecl_do:n

Implements the core functionality of \symdecl, and is called by \symdecl, \symdef and \abbrdef.

Ultimately stores the symbol $\langle \mathit{URI} \rangle$ in the property list \g_stex_symdecl_ $\langle \mathit{URI} \rangle$ _prop with fields:

- name (string),
- module (string),
- notations (sequence of strings; initially empty),
- local (boolean),
- type (token list),
- args (string of is, as and bs),
- arity (integer string),
- assocs (integer string; number of associative arguments),

\stex_get_symbol:n

Computes the full URI of a symbol from a macro argument, e.g. the macro name, the macro itself, the full URI...

\stex_invoke_symbol:n

TODO

\notation

 $\notation[\langle args \rangle] \{\langle symbol \rangle\} \{\langle notations^+ \rangle\}$

\stex_notation_do:nn

 $\stex_notation_do:nn{\langle \mathit{URI} \rangle} {\langle notations^+ \rangle}$

Implements the core functionality of \notation, and is called by \notation and \symdef.

Ultimately stores the notation in the property list \g_stex_notation_ $\langle \mathit{URI}\rangle \#\langle \mathit{variant}\rangle \#\langle \mathit{lang}\rangle _$ prop with fields:

- symbol (URI string),
- language (string),
- variant (string),
- opprec (integer string),
- argprecs (sequence of integer strings)

\stex_term_oms:nnnn \stex_term_oma:nnnn \stex_term_omb:nnnn $\langle \mathit{URI} \rangle \langle \mathit{fragment} \rangle \langle \mathit{precedence} \rangle \langle \mathit{body} \rangle$

Annotates $\langle body \rangle$ as an OMDoc-term (OMID, OMA or OMBIND, respectively) with head symbol $\langle URI \rangle$, generated by the specific notation $\langle fragment \rangle$ with (upwards) operator precedence $\langle precedence \rangle$. Inserts parentheses according to the current downwards precedence and operator precedence.

\stex_term_arg:nnn

 $\stex_term_arg:nnn\langle int \rangle\langle prec \rangle\langle body \rangle$

Annotates $\langle body \rangle$ as the $\langle int \rangle$ th argument of the current OMA or OMBIND, with (downwards) argument precedence $\langle prec \rangle$.

\stex_term_assoc_arg:nnnn

 $\stex_term_arg:nnn\langle int\rangle\langle prec\rangle\langle notation\rangle\langle body\rangle$

Annotates $\langle body \rangle$ as the $\langle int \rangle$ th (associative) sequence argument (as comma-separated list of terms) of the current OMA or OMBIND, with (downwards) argument precedence $\langle prec \rangle$ and associative notation $\langle notation \rangle$.

\infprec \neginfprec

Maximal and minimal notation precedences.

\STEXdobrackets

\STEXdobrackets $\{\langle body \rangle\}$

Puts $\langle body \rangle$ in parentheses; scaled if in display mode unscaled otherwise. Uses the current STEX brackets (by default (and)), which can be changed temporarily using \STEXwithbrackets.

\STEXwithbrackets

```
\STEXwithbrackets \langle left \rangle \langle right \rangle \{\langle body \rangle\}
```

Temporarily (i.e. within $\langle body \rangle$) sets the brackets used by STEX for automated bracketing (by default (and)) to $\langle left \rangle$ and $\langle right \rangle$.

Note that $\langle \mathit{left} \rangle$ and $\langle \mathit{right} \rangle$ need to be allowed after \left and \right in displaymode.

4 Implementation

4.1 The STEX document class

```
2 \RequirePackage{expl3,13keys2e}
         3 \ProvidesExplClass{stex}{2021/08/01}{1.9}{bla}

\stex_annotate:enw \stex_annotate_invisible:nn \stex_annotate_invisible:nnn

\l__stex_annotate_arg_tl

\c_stex_annotate_emptyarg_tl

\ stex annotate checkempty:n

We define four macros for introducing attributes in the HTML output. The definitions depend on the "backend" used (LATEXML, SCALATEX, pdflatex).

The pdflatex-macros largely do nothing; the SCAIATEX-implementations are pretty clear in what they do, the LATEXML-implementations resort to perl bindings.

```

                          4.3.3 File Hooks and Tracking
                            305 (@@=stex_files)
                               We introduce hooks for file inputs that keep track of the absolute paths of files used.
                          This will be useful to keep track of modules, their archives, namespaces etc.
                               Note that the absolute paths are only accurate in \input-statements for paths rel-
                          ative to the PWD, so they shouldn't be relied upon in any other setting than for STFX-
                           purposes.
   \g__stex_files_stack
                          keeps track of file changes
