The STEX3 Package Collection *

Michael Kohlhase, Dennis Müller FAU Erlangen-Nürnberg

http://kwarc.info/

2022-05-21

Abstract

STEX is a collection of LATEX packages that allow to markup documents semantically without leaving the document format.

Running 'pdflatex' over sTeX-annotated documents formats them into normal-looking PDF. But sTeX also comes with a conversion pipeline into semantically annotated HTML5, which can host semantic added-value services that make the documents active (i.e. interactive and user-adaptive) and essentially turning LATEX into a document format for (mathematical) knowledge management (MKM). STEX augments LATEX with

- semantic macros that denote and distinguish between mathematical concepts, operators, etc. independent of their notational presentation,
- a powerful module system that allows for authoring and importing individual fragments containing document text and/or semantic macros, independent of

 and without hard coding – directory paths relative to the current document,
 and
- a mechanism for exporting STEX documents to (modular) XHTML, preserving all the semantic information for semantically informed knowledge management services

This is the full documentation of STFX. It consists of four parts:

- Part I is a general manual for the STEX package and associated software. It is primarily directed at end-users who want to use STEX to author semantically enriched documents.
- Part II documents the macros provided by the STEX package. It is primarily directed at package authors who want to build on STEX, but can also serve as a reference manual for end-users.
- Part III documents additional packages that build on STEX, primarily its module system. These are not part of the STEX package itself, but useful additions enabled by STEX package functionality.
- Part IV is the detailled documentation of the STFX package implementation.

Part I Manual

Boxes like this one contain implementation details that are mostly relevant for more advanced use cases, might be useful to know when debugging, or might be good to know to better understand how something works. They can easily be skipped on a first read.

 $\begin{array}{l} \overset{\longleftarrow}{M} \xrightarrow{\longrightarrow} \text{Boxes like this one explain how some STeX concept relates to the MMT/OMDoc} \\ \overset{\longleftarrow}{M} \xrightarrow{\longrightarrow} \text{system, philosophy or language; see [MMT; Koh06] for introductions.} \end{array}$

Chapter 1

What is STEX?

Formal systems for mathematics (such as interactive theorem provers) have the potential to significantly increase both the accessibility of published knowledge, as well as the confidence in its veracity, by rendering the precise semantics of statements machine actionable. This allows for a plurality of added-value services, from semantic search up to verification and automated theorem proving. Unfortunately, their usefulness is hidden behind severe barriers to accessibility; primarily related to their surface languages reminiscent of programming languages and very unlike informal standards of presentation.

STEX minimizes this gap between informal and formal mathematics by integrating formal methods into established and widespread authoring workflows, primarily LATEX, via non-intrusive semantic annotations of arbitrary informal document fragments. That way formal knowledge management services become available for informal documents, accessible via an IDE for authors and via generated *active* documents for readers, while remaining fully compatible with existing authoring workflows and publishing systems.

Additionally, an extensible library of reusable document fragments is being developed, that serve as reference targets for global disambiguation, intermediaries for content exchange between systems and other services.

Every component of the system is designed modularly and extensibly, and thus lay the groundwork for a potential full integration of interactive theorem proving systems into established informal document authoring workflows.

The general STeX workflow combines functionalities provided by several pieces of software:

- The STEX package collection to use semantic annotations in IATEX documents,
- RusTeX [RT] to convert tex sources to (semantically enriched) xhtml,
- The MMT system [MMT], that extracts semantic information from the thus generated xhtml and provides semantically informed added value services.

Chapter 2

Quickstart

2.1 Setup

There are two ways of using STEX: as a

- 1. way of writing LATEX more modularly (object-oriented Math) for creating PDF documents or
- 2. foundation for authoring active documents in HTML5 instrumented with knowledge management services.

Both are legitimate and useful. The first requires a significantly smaller tool-chain, so we describe it first. The second requires a much more substantial (and experimental) toolchain of knowledge management systems. Both workflows profit from an integrated development environment (IDE), which (also) automates setup as far as possible (see subsection 2.1.4).

2.1.1 Minimal Setup for the PDF-only Workflow

In the best of all worlds, there is no setup, as you already have a new version of TEXLive on your system as a LATEX enthusiast. If not now is the time to install it; see [TL]. You can usually update TEXLive via a package manager or the TEXLive manager tlmgr.

Alternatively, you can install STEX from CTAN, the Comprehensive TEX Archive Network; see [ST] for details.

2.1.2 GIT-based Setup for the STFX Development Version

If you want use the latest and greatest STEX packages, you can that have not even been released to CTAN, then you can directly clone them from the STEX development repository [sTeX] by the following command-line instructions:

```
cd <stexdir>
git clone https://github.com/slatex/sTeX.git
```

and keep it updated by pulling updates via git pull in the cloned STEX directory. Then update your TEXINPUTS environment variable, e.g. by placing the following line in your .bashrc:

3

 $^{^{-1}\}mathrm{New~Part:}~$ MK: reorganized, we do not need the full MKM tool chain

2.1.3 STEX Archives (Manual Setup)

Writing semantically annotated STEX becomes much easier, if we can use well-designed libraries of already annotated content. STEX provides such libraries as STEX archives—i.e. GIT repositories at https://gl.mathhub.info—most prominently the SMGLoM libraries at https://gl.mathhub.info/smglom.

To do so, we set up a **local MathHub** by creating a MathHub directory <mhdir>. Every STEX archive as an **archive path** <apath> and a name <archive>. We can clone the STEX archive by the following command-line instructions:

```
cd <mhdir>/<apath>
git clone https://gl.mathhub.info/smglom/<archive>.git
```

Note that STEX archives often depend on other archives, thus you should be prepared to clone these as well – e.g. if pdflatex reports missing files. To make sure that STEX too knows where to find its archives, we need to set a global system variable MATHHUB, that points to your local MathHub-directory (see section 3.2).

export MATHHUB="<mhdir>''

2.1.4 The STEX IDE

We are currently working on an STEX IDE as an STEX plugin for VScode; see [SIa]. It will feature a setup procedure that automates the setup described above (and below). For additional functionality see the (now obsolete) plugin for STEX 1 [SLS; SIb].

2.1.5 Manual Setup for Active Documents and Knowledge Management Services

Foregoing on the STEX IDE, we will need several additional (on top of the minimal setup above) pieces of software; namely:

• The Mmt System available here². We recommend following the setup routine documented here.

Following the setup routine (Step 3) will entail designating a MathHub-directory on your local file system, where the MMT system will look for STEX/MMT content archives.

• STEX Archives If we only care about LATEX and generating pdfs, we do not technically need MMT at all; however, we still need the MATHHUB system variable to be set. Furthermore, MMT can make downloading content archives we might want to use significantly easier, since it makes sure that all dependencies of (often highly interrelated) STEX archives are cloned as well.

Once set up, we can run mmt in a shell and download an archive along with all of its dependencies like this: lmh install <name-of-repository>, or a whole group of archives; for example, lmh install smglom will download all smglom archives.

• $R_{US}T_{EX}$ The MMT system will also set up $R_{US}T_{EX}$ for you, which is used to generate (semantically annotated) xhtml from tex sources. In lieu of using MMT, you can also download and use $R_{US}T_{EX}$ directly here.

ENP:1

EdN:2

²EdNote: For now, we require the sTeX-branch, requiring manually compiling the MMT sources

2.2 A First STEX Document

Having set everything up, we can write a first STEX document. As an example, we will use the smglom/calculus and smglom/arithmetics archives, which should be present in the designated MathHub-folder, and write a small fragment defining the *geometric series*:

TODO: use some sTeX-archive instead of smglom, use a convergence-notion that includes the limit, mark-up the theorem properly

```
\documentclass{article}
  \usepackage{stex,xcolor,stexthm}
4 \begin{document}
 5 \begin{smodule}{GeometricSeries}
       \importmodule[smglom/calculus]{series}
      \importmodule[smglom/arithmetics]{realarith}
 7
 8
9
      \symdef{geometricSeries}[name=geometric-series]{\comp{S}}}
10
      \begin{sdefinition} [for=geometricSeries]
11
          The \definame{geometricSeries} is the \symname{?series}
13
          \[\defeq{\geometricSeries}{\definiens{
14
              \displaystyle \inf \{ \sup \{ svar\{n\} \} \} \} 
15
                  \realdivide[frac]{1}{
                      \realpower{2}{\svar{n}}
17
              }}
18
          }}.\]
19
      \end{sdefinition}
20
      \begin{sassertion} [name=geometricSeriesConverges, type=theorem]
21
      The \symname{geometricSeries} \symname{converges} towards $1$.
      \end{sassertion}
24 \end{smodule}
25 \end{document}
```

Compiling this document with pdflatex should yield the output

Definition 0.1. The **geometric series** is the series

$$S := \sum_{n=1}^{\infty} \frac{1}{2^n}.$$

Theorem 0.2. The geometric series converges towards 1.

Move your cursor over the various highlighted parts of the document – depending on your pdf viewer, this should yield some interesting (but possibly for now cryptic) information.

Remark 2.2.1:

Note that all of the highlighting, tooltips, coloring and the environment headers come from stexthm – by default, the amount of additional packages loaded is kept to a minimum and all the presentations can be customized, see <a href="https://chapter.com/chap

Let's investigate this document in detail to understand the respective parts of the STEX markup infrastructure:

```
\begin{smodule}{GeometricSeries}
...
\end{smodule}
```

smodule

First, we open a new *module* called GeometricSeries. The main purpose of the smodule environment is to group the contents and associate it with a *globally unique* identifier (URI), which is computed from the name GeometricSeries and the document context.

(Depending on your pdf viewer), the URI should pop up in a tooltip if you hover over the word **geometric series**.

```
\importmodule[smglom/calculus]{series}
\importmodule[smglom/arithmetics]{realarith}
```

\importmodule

Next, we *import* two modules – series from the STEX archive smglom/calculus, and realarith from the STEX archive smglom/arithmetics. If we investigate these archives, we find the files series.en.tex and realarith.en.tex (respectively) in their respective source-folders, which contain the statements \begin{smodule}{series} and \begin{smodule}{frealarith} (respectively).

The \importmodule-statements make all STEX symbols and associated semantic macros (e.g. \infinitesum, \realdivide, \realpower) in the imported module available to the current module GeometricSeries. The module GeometricSeries "exports" all of these symbols to all modules imports it via an \importmodule (GeometricSeries) instruction. Additionally it exports the local symbol \geometricSeries.

\usemodule

If we only want to *use* the content of some module Foo, e.g. in remarks or examples, but none of the symbols in our current module actually *depend* on the content of Foo, we can use \usemodule instead – like \importmodule, this will make the module content available, but will *not* export it to other modules.

```
\symdef{GeometricSeries} [name=geometric-series] {\comp{S}}
```

\symdef

Next, we introduce a new symbol with name geometric-series and assign it the semantic macro \geometricSeries. \symdef also immediately assigns this symbol a notation, namely S.

\comp

The macro \comp marks the S in the notation as a notational component, as opposed to e.g. arguments to \geometricSeries. It is the notational components that get highlighted and associated with the corresponding symbol (i.e. in this case geometricSeries). Since \geometricSeries takes no arguments, we can wrap the whole notation in a \comp.

```
\begin{sdefinition} [for=geometricSeries]
...
\end{sdefinition}
\begin{sassertion} [name=geometricSeriesConverges, type=theorem]
...
\end{sassertion}
```

What follows are two STEX-statements (e.g. definitions, theorems, examples, proofs, ...). These are semantically marked-up variants of the usual environments, which take additional optional arguments (e.g. for=, type=, name=). Since many LATEX templates predefine environments like definition or theorem with different syntax, we use sdefinition, sassertion, sexample etc. instead. You can customize these environments to e.g. simply wrap around some predefined theorem-environment. That way, we can still use sassertion to provide semantic information, while being fully compatible with (and using the document presentation of) predefined environments.

In our case, the stexthm-package patches e.g. \begin{sassertion}[type=theorem] to use a theorem-environment defined (as usual) using the amsthm package.

```
... is the \symname{?series}
```

\symname

The \symname-command prints the name of a symbol, highlights it (based on customizable settings) and associates the text printed with the corresponding symbol.

Note that the argument of \symref can be a local or imported symbol (here the series symbol is imported from the series module). STEX tries to determine the full symbol URI from the argument. If there are name clashes in or with the imported symbols, the name of the exporting module can be prepended to the symbol name before the ? character.

If you hover over the word series in the pdf output, you should see a tooltip showing the full URI of the symbol used.

\symref

The \symname-command is a special case of the more general \symref-command, which allows customizing the precise text associated with a symbol. \symref takes two arguments the first ist the symbol name, and the second a variant verbalization of the symbol, e.g. an inflection variant, a different language or a synonym. In our example \symname{?series} abbreviates \symref{?series}.

```
The \definame{geometricSeries} ...
```

\definame \definiendum

The sdefinition-environment provides two additional macros, \definame and \definiendum which behave similarly to \symname and \symref, but explicitly mark the symbols as being defined in this environment, to allow for special highlighting.

```
\[\defeq{\geometricSeries}{\definiens{
   \infinitesum{\svar{n}}{1}{
      \realdivide[frac]{1}{
      \realpower{2}{\svar{n}}
   }
}}.\]
```

The next snippet – set in a math environment – uses several semantic macros imported from (or recursively via) series and realarithmetics, such as \defeq, \infinitesum, etc. In math mode, using a semantic macro inserts its (default) definition. A semantic

macro can have several notations – in that case, we can explicitly choose a specific notation by providing its identifier as an optional argument; e.g. $\realdivide[frac]{a}{b}$ will use the explicit notation named frac of the semantic macro \realdivide , which yields $\frac{a}{b}$ instead of a/b.

\svar

The \svar{n} command marks up the n as a variable with name n and notation n.

\definiens

The **sdefinition**-environment additionally provides the \definiens-command, which allows for explicitly marking up its argument as the *definiens* of the symbol currently being defined.

2.2.1 OMDoc/xhtml Conversion

So, if we run pdflatex on our document, then STEX yields pretty colors and tooltips¹. But STEX becomes a lot more powerful if we additionally convert our document to xhtml while preserving all the STEX markup in the result.

TODO VSCode Plugin

Using $R_{US}T_{EX}$ [RT], we can convert the document to xhtml using the command rustex -i /path/to/file.tex -o /path/to/outfile.xhtml. Investigating the resulting file, we notice additional semantic information resulting from our usage of semantic macros, \symmetric Elow is the (abbreviated) snippet inside our \definiens block:

```
<mrow resource="" property="stex:definiens">
  <mrow resource="...?series?infinitesum" property="stex:OMBIND">
  <munderover displaystyle="true">
   <mo resource="...?series?infinitesum" property="stex:comp">∑</mo>
    <mrow resource="1" property="stex:arg">
     <mi resource="var://n" property="stex:OMV">n</mi>
    </mrow>
    <mo resource="...?series?infinitesum" property="stex:comp">=</mo>
    <mi resource="2" property="stex:arg">1</mi>
   <mi resource="...?series?infinitesum" property="stex:comp">\infty/mi>
  </munderover>
  <mrow resource="3" property="stex:arg">
   <mfrac resource="...?realarith?division#frac#" property="stex:OMA">
    <mi resource="1" property="stex:arg">1</mi>
<mrow resource="2" property="stex:arg">
  <msup resource="...realarith?exponentiation" property="stex:OMA">
      <mi resource="1" property="stex:arg">2</mi>
<mrow resource="2" property="stex:arg"></mi>
       <mi resource="var://n" property="stex:OMV">n</mi>
      </mrow>
     </msup>
    </mrow>
   </mfrac>
  </mrow>
 </mrow>
</mrow>
```

^{1...}and hyperlinks for symbols, and indices, and allows reusing document fragments modularly, and...

...containing all the semantic information. The MMT system can extract from this the following OpenMath snippet:

```
<OMBIND>
  <OMID name="n"/>
  <OMV name="n"/>
  <OMLIT name="1"/>
  <OMA>
    <OMS name="...?realarith?division"/>
    <OMLIT name="1"/>
  <OMA>
    <OMS name="...realarith?exponentiation"/>
    <OMLIT name="2"/>
    <OMLIT name="2"/>
    <OMV name="n"/>
    </OMA>
  </OMA>
</OMBIND>
```

...giving us the full semantics of the snippet, allowing for a plurality of knowledge management services – in particular when serving the xhtml.

Remark 2.2.2:

Note that the html when opened in a browser will look slightly different than the pdf when it comes to highlighting semantic content – that is because naturally html allows for much more powerful features than pdf does. Consequently, the html is intended to be served by a system like MMT, which can pick up on the semantic information and offer much more powerful highlighting, linking and similar features, and being customizable by readers rather than being prescribed by an author.

Additionally, not all browsers (most notably Chrome) support MATHML natively, and might require additional external JavaScript libraries such as MathJax to render mathematical formulas properly.

Chapter 3

Creating STeX Content

We can use STEX by simply including the package with \usepackage{stex}, or - primarily for individual fragments to be included in other documents - by using the STEX document class with \documentclass{stex} which combines the standalone document class with the stex package.

Both the stex package and document class offer the following options:

lang $(\langle language \rangle *)$ Languages to load with the babel package.

mathhub ($\langle directory \rangle$) MathHub folder to search for repositories – this is not necessary if the MATHHUB system variable is set.

sms $(\langle boolean \rangle)$ use persisted mode (not yet implemented).

image $(\langle boolean \rangle)$ passed on to tikzinput.

debug $(\langle log\text{-}prefix\rangle*)$ Logs debugging information with the given prefixes to the terminal, or all if all is given. Largely irrelevant for the majority of users.

3.1 How Knowledge is Organized in STEX

STFX content is organized on multiple levels:

- 1. STEX archives (see section 3.2) contain individual .tex-files.
- 2. These may contain STEX modules, introduced via \begin{smodule}{ModuleName}.
- 3. Modules contain STEX symbol declarations, introduced via \symdecl{symbolname}, \symdef{symbolname} and some other constructions. Most symbols have a notation that can be used via a semantic macro \symbolname generated by symbol declarations.
- 4. STeX expressions finally are built up from usages of semantic macros.

- STEX archives are simultaneously MMT archives, and the same directory structure is consequently used.
- STEX modules correspond to OMDoc/MMT theories. \importmodules (and

similar constructions) induce MMT includes and other theory morphisms, thus giving rise to a theory graph in the OMDOC sense [RK13].

- Symbol declarations induce OMDoc/MMT constants, with optional (formal) type and definiens components.
- Finally, STEX expressions are converted to OMDoc/MMT terms, which use the abstract syntax (and XML encoding) of OPENMATH [Bus+04].

3.2 STEX Archives

3.2.1 The Local MathHub-Directory

\userodule, \importmodule, \inputref etc. allow for including content modularly without having to specify absolute paths, which would differ between users and machines. Instead, STEX uses archives that determine the global namespaces for symbols and statements and make it possible for STEX to find content referenced via such URIs.

All STEX archives need to exist in the local MathHub-directory. STEX knows where this folder is via one of four means:

- 1. If the STEX package is loaded with the option mathhub=/path/to/mathhub, then STEX will consider /path/to/mathhub as the local MathHub-directory.
- 2. If the mathhub package option is *not* set, but the macro \mathhub exists when the \STEX-package is loaded, then this macro is assumed to point to the local MathHub-directory; i.e. \def\mathhub{/path/to/mathhub}\usepackage{stex} will set the MathHub-directory as path/to/mathhub.
- 3. Otherwise, STEX will attempt to retrieve the system variable MATHHUB, assuming it will point to the local MathHub-directory. Since this variant needs setting up only once and is machine-specific (rather than defined in tex code), it is compatible with collaborating and sharing tex content, and hence recommended.
- 4. Finally, if all else fails, STEX will look for a file ~/.stex/mathhub.path. If this file exists, STEX will assume that it contains the path to the local MathHub-directory. This method is recommended on systems where it is difficult to set environment variables.

3.2.2 The Structure of STeX Archives

An STEX archive group/name is stored in the directory /path/to/mathhub/group/name; e.g. assuming your local MathHub-directory is set as /user/foo/MathHub, then in order for the smglom/calculus-archive to be found by the STEX system, it needs to be in /user/foo/MathHub/smglom/calculus.

Each such archive needs two subdirectories:

- /source this is where all your tex files go.
- $\bullet\,$ /META-INF a directory containing a single file MANIFEST.MF, the content of which we will consider shortly

An additional lib-directory is optional, and is where STEX will look for files included via \\libinput.

Additionally a *group* of archives group/name may have an additional archive group/meta-inf. If this meta-inf-archive has a /lib-subdirectory, it too will be searched by \libinput from all tex files in any archive in the group/*-group.

We recommend the following additional directory structure in the source-folder of an ST_EX archive:

- /source/mod/ individual STEX modules, containing symbol declarations, notations, and \begin{sparagraph} [type=symdoc,for=...] environments for "encyclopaedic" symbol documentations
- /source/def/ definitions
- /source/ex/ examples
- /source/thm/ theorems, lemmata and proofs; preferably proofs in separate files to allow for multiple proofs for the same statement
- /source/snip/ individual text snippets such as remarks, explanations etc.
- /source/frag/ individual document fragments, ideally only \inputrefing snippets, definitions, examples etc. in some desirable order
- /source/tikz/ tikz images, as individual .tex-files
- /source/pic/ image files.³

3.2.3 MANIFEST.MF-Files

The MANIFEST.MF in the META-INF-directory consists of key-value-pairs, informing ST_EX (and associated software) of various properties of an archive. For example, the MANIFEST.MF of the smglom/calculus-archive looks like this:

```
id: smglom/calculus
```

source-base: http://mathhub.info/smglom/calculus
narration-base: http://mathhub.info/smglom/calculus

dependencies: smglom/arithmetics, smglom/sets, smglom/topology,

smglom/mv,smglom/linear-algebra,smglom/algebra

responsible: Michael.Kohlhase@FAU.de

title: Elementary Calculus

teaser: Terminology for the mathematical study of change.

description: desc.html

Many of these are in fact ignored by ST_EX, but some are important:

id: The name of the archive, including its group (e.g. smglom/calculus),

source-base or

ns: The namespace from which all symbol and module URIs in this repository are formed, see (TODO),

EdN:3

³Ednote: MK: bisher habe ich immer PIC subdirs, soll ich das ändern?

narration-base: The namespace from which all document URIs in this repository are formed, see (TODO),

url-base: The URL that is formed as a basis for external references, see (TODO),

dependencies: All archives that this archive depends on. STEX ignores this field, but MMT can pick up on them to resolve dependencies, e.g. for lmh install.

3.2.4 Using Files in STEX Archives Directly

Several macros provided by STEX allow for directly including files in repositories. These are:

\mhinput

\mhinput [Some/Archive] {some/file} directly inputs the file some/file in the source-folder of Some/Archive.

\inputref

\inputref[Some/Archive]{some/file} behaves like \mhinput, but wraps the input in a \begingroup ... \endgroup. When converting to xhtml, the file is not input at all, and instead an html-annotation is inserted that references the file, e.g. for lazy loading. In the majority of practical cases \inputref is likely to be preferred over \mhinput because it leads to less duplication in the generated xhtml.

\ifinput

Both \mhinput and \inputref set \iffinput to "true" during input. This allows for selectively including e.g. bibliographies only if the current file is not being currently included in a larger document.

\addmhbibresource

\addmhbibresource [Some/Archive] {some/file} searches for a file like \mhinput does, but calls \addbibresource to the result and looks for the file in the archive root directory directly, rather than the source directory. Typical invocations are

- \addmhbibresource{lib/refs.bib}, which specifies a bibliography in the lib folder in the local archive or
- \addmhbibresource[HW/meta-inf]{lib/refs.bib} in another.

\libinput

\libinput{some/file} searches for a file some/file in

- the lib-directory of the current archive, and
- the lib-directory of a meta-inf-archive in (any of) the archive groups containing the current archive

and include all found files in reverse order; e.g. \libinput{preamble} in a .tex-file in smglom/calculus will first input .../smglom/meta-inf/lib/preamble.tex and then ../smglom/calculus/lib/preamble.tex.

\libinput will throw an error if no candidate for some/file is found.

\libusepackage

\lambda libusepackage [package-options] {some/file} searches for a file some/file.sty in the same way that \libinput does, but will call

\usepackage[package-options]{path/to/some/file} instead of \input.

\libusepackage throws an error if not exactly one candidate for some/file is found.

Remark 3.2.1:

Then the preamble.tex files can take care of loading the generally required packages, setting presentation customizations etc. (per archive or archive group or both), and postamble.tex can e.g. print the bibliography, index etc.

\lambda libusepackage is particularly useful in preamble.tex when we want to use custom packages that are not part of TeXLive. In this case we commit the respective packages in one of the lib folders and use \libusepackage to load them.

3.3 Module, Symbol and Notation Declarations

3.3.1 The smodule-Environment

smodule A new module is declared using the basic syntax

```
\begin{smodule} [options] {ModuleName}...\end{smodule}.
```

A module is required to declare any new formal content such as symbols or notations (but not variables, which may be introduced anywhere).

The smodule-environment takes several keyword arguments, all of which are optional:

```
title (\langle token\ list \rangle) to display in customizations.
```

type $(\langle string \rangle *)$ for use in customizations.

deprecate $(\langle module \rangle)$ if set, will throw a warning when loaded, urging to use $\langle module \rangle$ instead.

id $(\langle string \rangle)$ for cross-referencing.

ns $(\langle URI \rangle)$ the namespace to use. Should not be used, unless you know precisely what you're doing. If not explicitly set, is computed using $\text{stex_modules_current_namespace:}$.

lang $(\langle language \rangle)$ if not set, computed from the current file name (e.g. foo.en.tex).

sig (\language\rangle) if the current file is a translation of a file with the same base name but a different language suffix, setting sig=<lang> will preload the module from that language file. This helps ensuring that the (formal) content of both modules is (almost) identical across languages and avoids duplication.

```
creators (\langle string \rangle *) names of the creators.
contributors (\langle string \rangle *) names of contributors.
srccite (\langle string \rangle) a source citation for the content of this module.
```

```
\begin{tabular}{ll} & \begin{tabular}{ll}
```

By default, opening a module will produce no output whatsoever, e.g.:

Example 1

```
Input:
```

```
1 \begin{smodule}[title={This is Some Module}]{SomeModule}
2    Hello World
3 \end{smodule}
```

Output:

Hello World

\stexpatchmodule

We can customize this behavior either for all modules or only for modules with a specific type using the command \stexpatchmodule[optional-type]{begin-code}{end-code}. Some optional parameters are then available in \smodule*-macros, specifically \smoduletitle, \smoduletype and \smoduleid.

For example:

Example 2

```
Input:
```

```
1 \stexpatchmodule[display]
2 {\textbf{Module (\smoduletitle)}\par}
3 {\par\noindent\textbf{End of Module (\smoduletitle)}}
4
5 \begin{smodule}[type=display,title={Some New Module}]{SomeModule2}
6 Hello World
7 \end{smodule}
```

Output:

```
Module (Some New Module)

Hello World

End of Module (Some New Module)
```

.

3.3.2 Declaring New Symbols and Notations

Inside an smodule environment, we can declare new STFX symbols.

\symdecl

The most basic command for doing so is using \symdecl{symbolname}. This introduces a new symbol with name symbolname, arity 0 and semantic macro \symbolname.

The starred variant \symdecl*{symbolname} will declare a symbol, but not introduce a semantic macro. If we don't want to supply a notation (for example to introduce concepts like "abelian", which is not something that has a notation), the starred variant is likely to be what we want.

Without a semantic macro or a notation, the only meaningful way to reference a symbol is via \symref,\symname etc.

```
Example 3
Input:

1 \symdecl*{foo}
2 Given a \symname{foo}, we can...

Output:

Given a foo, we can...
```

.

Obviously, most semantic macros should take actual *arguments*, implying that the symbol we introduce is an *operator* or *function*. We can let \symdecl know the *arity* (i.e. number of arguments) of a symbol like this:

```
Example 4
Input:

1 \symdecl{binarysymbol}[args=2]
2 \symref{binarysymbol}{this} is a symbol taking two arguments.

Output:

this is a symbol taking two arguments.
```

.

So far we have gained exactly \dots nothing by adding the arity information: we cannot do anything with the arguments in the text.

We will now see what we can gain with more machinery.

\notation

We probably want to supply a notation as well, in which case we can finally actually use the semantic macro in math mode. We can do so using the **\notation** command, like this:

```
this:

Example 5

Input:

1 \notation{binarysymbol}{\text{First: }#1\text{; Second: }#2}
2 $\binarysymbol{a}{b}$

Output:

First: a; Second: b
```

```
←M→ Applications of semantic macros, such as \binarysymbol{a}{b} are translated to −M→ MMT/OMDOC as OMA-terms with head <OMS name="...?binarysymbol"/>.

T→ Semantic macros with no arguments correspond to OMS directly.
```

\comp

For many semantic services e.g. semantic highlighting or **wikification** (linking uservisible notation components to the definition of the respective symbol they come from), we need to specify the notation components. Unfortunately, there is currently no way the STEX engine can infer this by itself, so we have to specify it manually in the notation specification. We can do so with the \comp command.

We can introduce a new notation highlight for \binarysymbol that fixes this flaw, which we can subsequently use with \binarysymbol[highlight]:

```
Example 6
```

```
Input:
```

```
1 \notation{binarysymbol}[highlight]
2     {\comp{\text{First: }}#1\comp{\text{; Second: }}#2}
3 $\binarysymbol[highlight]{a}{b}$
```

Output:

```
First: a; Second: b
```

Ideally, \comp would not be necessary: Everything in a notation that is *not* an argument should be a notation component. Unfortunately, it is computationally expensive to determine where an argument begins and ends, and the argument markers #n may themselves be nested in other macro applications or TEX groups, making it ultimately almost impossible to determine them automatically while also remaining compatible with arbitrary highlighting customizations (such as tooltips, hyperlinks, colors) that users might employ, and that are ultimately invoked by \comp.

Note that it is required that

- 1. the argument markers #n never occur inside a \comp, and
- 2. no semantic arguments may ever occur inside a notation.

Both criteria are not just required for technical reasons, but conceptionally meaningful:

The underlying principle is that the arguments to a semantic macro represent arguments to the mathematical operation represented by a symbol. For example, a semantic macro $\addition\{a\}\{b\}$ taking two arguments would represent the actual addition of (mathematical objects) a and b. It should therefore be impossible for a or b to be part of a notation component of \addition .

Similarly, a semantic macro can not conceptually be part of the notation of \addition, since a semantic macro represents a distinct mathematical concept with its own semantics, whereas notations are syntactic representations of the very symbol to which the notation belongs.

If you want an argument to a semantic macro to be a purely syntactic parameter, then you are likely somewhat confused with respect to the distinction between the precise syntax and semantics of the symbol you are trying to declare (which happens quite often even to experienced STEX users), and might want to give those another thought - quite likely, the macro you aim to implement does not actually represent a semantically meaningful mathematical concept, and you will want to use \def and similar native LATEX macro definitions rather than semantic macros.

\symdef

In the vast majority of cases where a symbol declaration should come with a semantic macro, we will want to supply a notation immediately. For that reason, the \symdef command combines the functionality of both \symdecl and \notation with the optional arguments of both:

```
Example 7
```

```
Input:
```

```
1 \symdef{newbinarysymbol}[h1,args=2]
2     {\comp{\text{1.: }}#1\comp{\text{; 2.: }}#2}
3 $\newbinarysymbol{a}{b}$
```

Output:

```
1.: a; 2.: b
```

We just declared a new symbol newbinarysymbol with args=2 and immediately provided it with a notation with identifier hl. Since hl is the *first* (and so far, only) notation supplied for newbinarysymbol, using \newbinarysymbol without optional argument defaults to this notation.

But one man's meat is another man's poison: it is very subjective what the "default notation" of an operator should be. Different communities have different practices. For instance, the complex unit is written as i in Mathematics and as j in electrical engineering.

So to allow modular specification and facilitate re-use of document fragments ST_EX allows to re-set notation defaults.

\setnotation

The first notation provided will stay the default notation unless explicitly changed — this is enabled by the \setnotation command: \setnotation{symbolname}{notation-id} sets the default notation of \symbolname to notation-id, i.e. henceforth, \symbolname behaves like \symbolname[notation-id] from now on.

Often, a default notation is set right after the corresponding notation is introduced – the starred version \notation* for that reason introduces a new notation and immediately sets it to be the new default notation. So expressed differently, the first \notation for a symbol behaves exactly like \notation*, and \notation*{foo}[bar]{...} behaves exactly like \notation{foo}{bar}.

Operator Notations

Once we have a semantic macro with arguments, such as *\newbinarysymbol*, the semantic macro represents the *application* of the symbol to a list of arguments. What if we want to refer to the operator *itself*, though?

We can do so by supplying the \notation (or \symdef) with an operator notation, indicated with the optional argument op=. We can then invoke the operator notation using \symbolname! [notation-identifier]. Since operator notations never take arguments, we do not need to use \comp in it, the whole notation is wrapped in a \comp automatically:

3.3.3 Argument Modes

directly.

The notations so far used <code>simple</code> arguments which we call <code>mode-i</code> arguments. Declaring a new symbol with <code>\symdecl{foo}[args=3]</code> is equivalent to writing <code>\symdecl{foo}[args=iii]</code>, indicating that the semantic macro takes three mode-i arguments. However, there are three more argument modes which we will investigate now, namely mode-b, mode-a and mode-B arguments.

Mode-b Arguments

A mode-b argument represents a variable that is bound by the symbol in its application, making the symbol a binding operator. Typical examples of binding operators are e.g. sums \sum , products \prod , integrals \int , quantifiers like \forall and \exists , that λ -operator, etc.

For example, we can implement a summation operator binding an index variable and taking lower and upper index bounds and the expression to sum over like this:

```
Example 9
```

Input:

```
1 \symdef{summation}[args=biii]
2 {\mathop{\comp{\sum}}_{#1\comp{=}#2}^{#3}#4}
3 $\summation{\svar{x}}{1}{\svar{n}}{\svar{x}}^2$
```

Output:

```
\sum_{x=1}^{n} x^2
```

where the variable x is now bound by the \summation-symbol in the expression.

Mode-a Arguments

Mode-a arguments represent a *flexary argument sequence*, i.e. a sequence of arguments of arbitrary length. Formally, operators that take arbitrarily many arguments don't "exist", but in informal mathematics, they are ubiquitous. Mode-a arguments allow us to write e.g. \addition{a,b,c,d,e} rather than having to write something like \addition{a}{\addition{b}{\addition{b}}}!

\notation (and consequently \symdef, too) take one additional argument for each mode-a argument that indicates how to "accumulate" a comma-separated sequence of arguments. This is best demonstrated on an example.

Let's say we want an operator representing quantification over an ascending chain of elements in some set, i.e. $\ascendingchain{S}{a,b,c,d,e}{t}$ should yield $\forall a < sb < sc < sd < se$. The "base"-notation for this operator is simply

 ${\operatorname{1}} \#2\operatorname{2},\$, where #2 represents the full notation fragment *accumulated* from {a,b,c,d,e}.

The additional argument to \notation (or \symdef) takes the same arguments as the base notation and two additional arguments ##1 and ##2 representing successive pairs in the mode-a argument, and accumulates them into #2, i.e. to produce $a <_S b <_S c <_S d <_S e$, we do {##1 \comp{<}_{#1} ##2}:

Example 10

Input:

```
1 \symdef{ascendingchain}[args=iai]
2 {\comp{\forall} #2\comp{.\,}#3}
3 {##1 \comp{<}_{#1} ##2}
4
5 Tadaa: $\ascendingchain{S}{a,b,c,d,e}{t}$</pre>
```

Output:

```
Tadaa: \forall a <_S b <_S c <_S d <_S e.t
```

If this seems overkill, keep in mind that you will rarely need the single-hash arguments #1,#2 etc. in the a-notation-argument. For a much more representative and simpler example, we can introduce flexary addition via:

Example 11

```
Input:

1 \symdef{addition}[args=a]{#1}{##1 \comp{+} ##2}
2 3 Tadaa: $\addition{a,b,c,d,e}$

Output:
```

Tadaa: a+b+c+d+e

The assoc-key We mentioned earlier that "formally", flexary arguments don't really "exist". Indeed, formally, addition is usually defined as a binary operation, quantifiers bind a single variable etc.

Consequently, we can tell STEX (or, rather, MMT/OMDoc) how to "resolve" flexary arguments by providing \symdecl or \symdef with an optional assoc-argument, as in \symdecl{addition}[args=a,assoc=bin]. The possible values for the assoc-key are:

bin: A binary, associative argument, e.g. as in \addition

binl: A binary, left-associative argument, e.g. $a^{b^{c^d}}$, which stands for $((a^b)^c)^d$

binr: A binary, right-associative argument, e.g. as in $A \to B \to C \to D$, which stands for $A \to (B \to (C \to D))$

pre: Successively prefixed, e.g. as in $\forall x, y, z. P$, which stands for $\forall x. \forall y. \forall z. P$

conj: Conjunctive, e.g. as in a=b=c=d or $a,b,c,d\in A$, which stand for $a=d\wedge b=d\wedge c=d$ and $a\in A\wedge b\in A\wedge c\in A\wedge d\in A$, respectively

pwconj: Pairwise conjunctive, e.g. as in $a \neq b \neq c \neq d$, which stands for $a \neq b \land a \neq c \land a \neq d \land b \neq c \land b \neq d \land c \neq d$

As before, at the PDF level, this annotation is invisible (and without effect), but at the level of the generated OMDoc/MMT this leads to more semantical expressions.

Mode-B Arguments

Finally, mode-B arguments simply combine the functionality of both a and b - i.e. they represent an arbitrarily long sequence of variables to be bound, e.g. for implementing quantifiers:

Example 12

```
Input:

1 \symdef{quantforall}[args=Bi]
2 {\comp{\forall}#1\comp{.}#2}
3 {##1\comp,##2}
4
5 $\quantforall{\svar{x},\svar{y},\svar{z}}{P}$
```

Output:

```
\forall x,y,z.P
```

3.3.4 Type and Definiens Components

\symdecl and \symdef take two more optional arguments. TEX largely ignores them (except for special situations we will talk about later), but MMT can pick up on them for additional services. These are the type and def keys, which expect expressions in math-mode (ideally using semantic macros, of course!)

```
The type and def keys correspond to the type and definiens components of 

M > OMDoc/Mmt constants.

M > Correspondingly, the name "type" should be taken with a grain of salt, since 

OMDoc/Mmt being foundation-independent – does not a priori implement a fixed typing system.
```

The type-key allows us to provide additional information (given the necessary STEX symbols), e.g. for addition on natural numbers:

Example 13

Input:

```
1 \symdef{Nat}[type=\set]{\comp{\mathbb N}}
2 \symdef{addition}[
3     type=\funtype{\Nat,\Nat}{\Nat},
4     op=+,
5     args=a
6 ]{#1}{##1 \comp+ ##2}
7
8 \symname{addition} is an operation $\funtype{\Nat,\Nat}{\Nat}$
```

Output:

```
addition is an operation \mathbb{N}{\times}\mathbb{N}{\to}\mathbb{N}
```

.

The def-key allows for declaring symbols as abbreviations:

Example 14

Input:

```
1 \symdef{successor}[
2    type=\funtype{\Nat}{\Nat},
3    def=\fun{\svar{x}}{\addition{\svar{x},1}},
4    op=\mathtt{succ},
5    args=1
6 ]{\comp{\mathtt{succ(}#1\comp{)}}}
7
8 The \symname{successor} operation $\funtype{\Nat}{\Nat}$
9 is defined as $\fun{\svar{x}}{\addition{\svar{x},1}}$
```

Output:

```
The successor operation \mathbb{N} \to \mathbb{N} is defined as x \mapsto x+1
```

3.3.5 Precedences and Automated Bracketing

Having done \addition , the obvious next thing to implement is $\mbox{\it multiplication}$. This is straight-forward in theory:

Example 15

```
Input:
```

```
1 \symdef{multiplication}[
2  type=\funtype{\Nat,\Nat}{\Nat},
3  op=\cdot,
4  args=a
5 ]{#1}{##1 \comp\cdot ##2}
6
7 \symname{multiplication} is an operation $\funtype{\Nat,\Nat}{\Nat}$
```

Output:

```
multiplication is an operation \mathbb{N} \times \mathbb{N} \rightarrow \mathbb{N}
```

However, if we *combine* \addition and \multiplication, we notice a problem:

Example 16

Input:

```
1 \addition{a,\multiplication{b,\addition{c,\multiplication{d,e}}}} \\
```

Output:

```
a+b\cdot c+d\cdot e
```

.

We all know that \cdot binds stronger than +, so the output $a+b\cdot c+d\cdot e$ does not actually reflect the term we wrote. We can of course insert parentheses manually

```
Example 17 Input:  1 \addition{a, \multiplication{b, (\addition{c, \multiplication{d,e}})}}  Output:  a+b\cdot(c+d\cdot e)
```

but we can also do better by supplying *precedences* and have ST_EX insert parentheses automatically.

For that purpose, \notation (and hence \symdef) take an optional argument prec=<opprec>;<argprec1>x...x<argprec n>.

We will investigate the precise meaning of <opprec> and the <argprec>s shortly – in the vast majority of cases, it is perfectly sufficient to think of prec= taking a single number and having that be *the* precedence of the notation, where lower precedences (somewhat counterintuitively) bind stronger than higher precedences. So fixing our notations for \addition and \multiplication, we get:

Example 18

Input:

```
1 \notation{multiplication}[
2    op=\cdot,
3    prec=50
4]{#1}{##1 \comp\cdot ##2}
5 \notation{addition}[
6    op=+,
7    prec=100
8]{#1}{##1 \comp+ ##2}
9
10 $\addition{a,\multiplication{b,\addition{c,\multiplication{d,e}}}}$
```

Output:

```
a + b \cdot (c + d \cdot e)
```

.

Note that the precise numbers used for precedences are pretty arbitrary - what matters is which precedences are higher than which other precedences when used in conjunction.

\infprec \neginfprec

It is occasionally useful to have "infinitely" high or low precedences to enforce or forbid automated bracketing entirely – for those purposes, \infprec and \neginfprec exist (which are implemented as the maximal and minimal integer values accordingly).

More precisely, each notation takes

- 1. One operator precedence and
- 2. one argument precedence for each argument.

By default, all precedences are 0, unless the symbol takes no argument, in which case the operator precedence is \neginfprec (negative infinity). If we only provide a single number, this is taken as both the operator precedence and all argument precedences.

STEX decides whether to insert parentheses by comparing operator precedences to a downward precedence p_d with initial value \infprec. When encountering a semantic macro, STEX takes the operator precedence p_{op} of the notation used and checks whether $p_{op} > p_d$. If so, STEX insert parentheses.

When SIEX steps into an argument of a semantic macro, it sets p_d to the respective argument precedence of the notation used.

In the example above:

- 1. STeX starts out with $p_d = \$
- 2. STeX encounters \addition with $p_{op} = 100$. Since $100 \not>$ \infprec, it inserts no parentheses.
- 3. Next, STeX encounters the two arguments for \addition. Both have no specifically provided argument precedence, so STeX uses $p_d = p_{op} = 100$ for both and recurses.
- 4. Next, STEX encounters \multiplication{b,...}, whose notation has $p_{op} = 50$
- 5. We compare to the current downward precedence p_d set by \addition, arriving at $p_{op} = 50 > 100 = p_d$, so SIEX again inserts no parentheses.
- 6. Since the notation of \multiplication has no explicitly set argument precedences, STEX uses the operator precedence for all arguments of \multiplication, hence sets $p_d = p_{op} = 50$ and recurses.
- 7. Next, STEX encounters the inner \addition{c,...} whose notation has $p_{op} = 100$.
- 8. We compare to the current downward precedence p_d set by \multiplication, arriving at $p_{op} = 100 > 50 = p_d$ which finally prompts STEX to insert parentheses, and we proceed as before.

3.3.6 Variables

All symbol and notation declarations require a module with which they are associated, hence the commands \symdecl, \notation, \symdef etc. are disabled outside of smodule-environments.

Variables are different – variables are allowed everywhere, are not exported when the current module (if one exists) is imported (via \importmodule or \usemodule) and (also unlike symbol declarations) "disappear" at the end of the current TeX group.

\svar

So far, we have always used variables using n , which marks-up n as a variable with name n. More generally, $\operatorname{svar}[foo]$ (<texcode>) marks-up the arbitrary <texcode> as representing a variable with name foo.

Of course, this makes it difficult to reuse variables, or introduce "functional" variables with arities > 0, or provide them with a type or definiens.

\vardef

For that, we can use the \vardef command. Its syntax is largely the same as that of \symdef, but unlike symbols, variables have only one notation (TODO: so far?), hence there is only \vardef and no \vardecl.

Example 19 Input:

```
1 \vardef{varf}[
2     name=f,
3     type=\funtype{\Nat}{\Nat},
4     op=f,
5     args=1,
6     prec=0;\neginfprec
7 ]{\comp{f}#1}
8 \vardef{varn} [name=n,type=\Nat]{\comp{n}}
9 \vardef{varx} [name=x,type=\Nat]{\comp{x}}
10
11 Given a function $\varf!:\funtype{\Nat}{\Nat}$,
12 by $\addition{\varf!,\varn}$ we mean the function
13 $\fun{\varx}{\varf}\addition{\varx,\varn}}$
```

Output:

```
Given a function f: \mathbb{N} \to \mathbb{N}, by f+n we mean the function x \mapsto f(x+n)
```

(of course, "lifting" addition in the way described in the previous example is an operation that deserves its own symbol rather than abusing \addition , but... well.)

TODO: bind=forall/exists

3.3.7 Variable Sequences

Variable sequences occur quite frequently in informal mathematics, hence they deserve special support. Variable sequences behave like variables in that they disappear at the end of the current TEX group and are not exported from modules, but their declaration is quite different.

\varseq

A variable sequence is introduced via the command \warseq, which takes the usual optional arguments name and type. It then takes a starting index, an end index and a notation for the individual elements of the sequence parametric in an index. Note that both the starting as well as the ending index may be variables.

This is best shown by example:

Example 20 Input:

```
1 \vardef{varn}[name=n,type=\Nat]{\comp{n}}
2 \varseq{seqa}[name=a,type=\Nat]{1}{\varn}{\comp{a}_{#1}}
3
4 The $i$th index of $\seqa!$ is $\seqa{i}$.
```

Output:

```
The ith index of a_1, \ldots, a_n is a_i.
```

.

Note that the syntax \seqa! now automatically generates a presentation based on the starting and ending index.

TODO: more notations for invoking sequences.

Notably, variable sequences are nicely compatible with a-type arguments, so we can do the following:

Example 21

Input:

```
1 $\addition{\seqa}$
```

Output:

```
a_1 + \ldots + a_n
```

.

Sequences can be multidimensional using the args-key, in which case the notation's arity increases and starting and ending indices have to be provided as a comma-separated list:

Example 22

```
Input:
```

```
1 \vardef{varm}[name=m,type=\Nat]{\comp{m}}
2 \varseq{seqa}[
3     name=a,
4     args=2,
5     type=\Nat,
6 ]{1,1}{\varm,\varm}{\comp{a}_{#1}^{#2}}
7
8 $\seqa!$ and $\addition{\seqa}$
```

Output:

```
a_1^1, \ldots, a_n^m and a_1^1 + \ldots + a_n^m
```

'We can also explicitly provide a "middle" segment to be used, like such:

Example 23

Input:

```
1 \varseq{seqa}[
2    name=a,
3    type=\Nat,
4    args=2,
5    mid={\comp{a}_{\varn}^1,\comp{a}_1^2,\ellipses,\comp{a}_{1}^{\varn}}
6]{1,1}{\varn,\varm}{\comp{a}_{\alpha}^{\#1}^{\#2}}
7
8 $\seqa!$ and $\addition{\seqa}$
```

Output:

```
a_1^1, \dots, a_n^1, a_1^2, \dots, a_1^m, \dots, a_n^m \text{ and } a_1^1 + \dots + a_n^1 + a_1^2 + \dots + a_n^m + \dots + a_n^m
```

3.4 Module Inheritance and Structures

The STEX features for modular document management are inherited from the OM-Doc/MMT model that organizes knowledge into a graph, where the nodes are theories (called modules in STEX) and the edges are truth-preserving mappings (called theory morphismes in MMT). We have already seen modules/theories above.

Before we get into theory morphisms in STEX we will see a very simple application of modules: managing multilinguality modularly.

3.4.1 Multilinguality and Translations

If we load the STeX document class or package with the option lang=<lang>, STeX will load the appropriate babel language for you – e.g. lang=de will load the babel language ngerman. Additionally, it makes STeX aware of the current document being set in (in this example) german. This matters for reasons other than mere babel-purposes, though:

Every module is assigned a language. If no STEX package option is set that allows for inferring a language, STEX will check whether the current file name ends in e.g. .en.tex (or .de.tex or .fr.tex, or...) and set the language accordingly. Alternatively, a language can be explicitly assigned via \begin{smodule}[lang=<language>]{Foo}.

```
Technically, each smodule-environment induces two OMDoc/MMT theories: \begin{smodule}[lang=<lang>]{Foo} generates a theory some/namespace?Foo that only contains the "formal" part of the module – i.e. exactly the content—M→ that is exported when using \importmodule.

TAMAGINATION Additionally, MMT generates a language theory some/namespace/Foo?<lang> that includes some/namespace?Foo and contains all the other document content – variable declarations, includes for each \usenbodule, etc.
```

Notably, the language suffix in a filename is ignored for \usemodule, \importmodule and in generating/computing URIs for modules. This however allows for providing translations for modules between languages without needing to duplicate content:

If a module Foo exists in e.g. english in a file Foo.en.tex, we can provide a file Foo.de.tex right next to it, and write \begin{smodule}[sig=en]{Foo}. The sig-key

then signifies, that the "signature" of the module is contained in the *english* version of the module, which is immediately imported from there, just like \importmodule would.

Additionally to translating the informal content of a module file to different languages, it also allows for customizing notations between languages. For example, the least common multiple of two numbers is often denoted as $\mathtt{lcm}(a,b)$ in english, but is called kleinstes gemeinsames Vielfaches in german and consequently denoted as $\mathtt{kgV}(a,b)$ there

We can therefore imagine a german version of an lcm-module looking something like this:

```
1 \begin{smodule}[sig=en]{lcm}
2 \notation*{lcm}[de]{\comp{\mathtt{kgV}}(#1,#2)}
3
4 Das \symref{lcm}{kleinste gemeinsame Vielfache}
5 $\lcm{a,b}$ von zwei Zahlen $a,b$ ist...
6 \end{smodule}
```

If we now do \importmodule{lcm} (or \usemodule{lcm}) within a german document, it will also load the content of the german translation, including the de-notation for \lcm.

3.4.2 Simple Inheritance and Namespaces

\importmodule \usemodule

\importmodule[Some/Archive]{path?ModuleName} is only allowed within an smodule-environment and makes the symbols declared in ModuleName available therein. Additionally the symbols of ModuleName will be exported if the current module is imported somewhere else via \importmodule.

\userbase module behaves the same way, but without exporting the content of the used module.

It is worth going into some detail how exactly \importmodule and \usemodule resolve their arguments to find the desired module – which is closely related to the namespace generated for a module, that is used to generate its URI.

Ideally, STeX would use arbitrary URIs for modules, with no forced relationships between the *logical* namespace of a module and the *physical* location of the file declaring the module – like MMT does things.

Unfortunately, TEX only provides very restricted access to the file system, so we are forced to generate namespaces systematically in such a way that they reflect the physical location of the associated files, so that STEX can resolve them accordingly. Largely, users need not concern themselves with namespaces at all, but for completenesses sake, we describe how they are constructed:

- If $\begin{smodule}{foo} occurs in a file /path/to/file/Foo[.<math>\langle lang \rangle$].tex which does not belong to an archive, the namespace is file://path/to/file.
- If the same statement occurs in a file /path/to/file/bar[. \(\lang\rang\rang\right)\]. tex, the namespace is file://path/to/file/bar.

In other words: outside of archives, the namespace corresponds to the file URI with the filename dropped iff it is equal to the module name, and ignoring the (optional) language suffix.

If the current file is in an archive, the procedure is the same except that the initial segment of the file path up to the archive's **source**-folder is replaced by the archive's namespace URI.

Conversely, here is how namespaces/URIs and file paths are computed in import statements, examplary \importmodule:

- \importmodule{Foo} outside of an archive refers to module Foo in the current namespace. Consequently, Foo must have been declared earlier in the same document or, if not, in a file Foo[.\langle].tex in the same directory.
- The same statement within an archive refers to either the module Foo declared earlier in the same document, or otherwise to the module Foo in the archive's top-level namespace. In the latter case, is has to be declared in a file Foo[.\lang].tex directly in the archive's source-folder.
- Similarly, in \importmodule{some/path?Foo} the path some/path refers to either the sub-directory and relative namespace path of the current directory and namespace outside of an archive, or relative to the current archive's top-level namespace and source-folder, respectively.

- Similarly, \importmodule[Some/Archive]{some/path?Foo} is resolved like the previous cases, but relative to the archive Some/Archive in the mathhub-directory.
- Finally, \importmodule{full://uri?Foo} naturally refers to the module Foo in the namespace full://uri. Since the file this module is declared in can not be determined directly from the URI, the module must be in memory already, e.g. by being referenced earlier in the same document. Since this is less compatible with a modular development, using full URIs directly is strongly discouraged, unless the module is delared in the current file directly.

\STEXexport

\importmodule and \usemodule import all symbols, notations, semantic macros and (recursively) \importmodules. If you want to additionally export e.g. convenience macros and other (STEX) code from a module, you can use the command \STEXexport{<code>} in your module. Then <code> is executed (both immediately and) every time the current module is opened via \importmodule or \usemodule.

Note, that **\newcommand** defines macros *globally* and throws an error if the macro already exists, potentially leading to low-level LATEX errors if we put a **\newcommand** in an **\STEXexport** and the **<code>** is executed more than once in a document – which can happen easily.

A safer alternative is to use macro definition principles, that are safe to use even if the macro being defined already exists, and ideally are local to the current TFX

3.4.3 The mathstructure Environment

A common occurrence in mathematics is bundling several interrelated "declarations" together into *structures*. For example:

- A monoid is a structure $\langle M, \circ, e \rangle$ with $\circ : M \times M \to M$ and $e \in M$ such that...
- A topological space is a structure $\langle X, \mathcal{T} \rangle$ where X is a set and \mathcal{T} is a topology on X
- A partial order is a structure $\langle S, \leq \rangle$ where \leq is a binary relation on S such that...

This phenomenon is important and common enough to warrant special support, in particular because it requires being able to *instantiate* such structures (or, rather, structure *signatures*) in order to talk about (concrete or variable) *particular* monoids, topological spaces, partial orders etc.

mathstructure

The mathstructure environment allows us to do exactly that. It behaves exactly like the smodule environment, but is itself only allowed inside an smodule environment, and allows for instantiation later on.

How this works is again best demonstrated by example:

Example 24

Input:

```
1 \begin{mathstructure} { monoid}
2 \symdef { universe} [ type=\set] { \comp{U}}
3 \symdef { op} [
4 \args=2,
5 \type=\funtype{\universe, \universe} { \universe},
6 \op=\circ
7 \ ] { #1 \comp{\circ} #2}
8 \symdef { unit} [ type=\universe] { \comp{e}}
9 \end{mathstructure}
10
11 A \symname{monoid} is...
```

Output:

```
A monoid is...
```

Note that the \symname{monoid} is appropriately highlighted and (depending on your pdf viewer) shows a URI on hovering – implying that the mathstructure environment has generated a *symbol* monoid for us. It has not generated a semantic macro though, since we can not use the monoid-symbol *directly*. Instead, we can instantiate it, for example for integers:

```
Example 25 Input:
```

```
1 \symdef{Int}[type=\set]{\comp{\mathbb Z}}
2 \symdef{addition}[
3     type=\funtype{\Int,\Int},\Int},
4     args=2,
5     op=+
6 ]{##1 \comp{+} ##2}
7 \symdef{zero}[type=\Int]{\comp{0}}
8
9 $\mathstruct{\Int,\addition!,\zero}$ is a \symname{monoid}.
```

Output:

```
\langle \mathbb{Z}, +, 0 \rangle is a monoid.
```

So far, we have not actually instantiated monoid, but now that we have all the symbols to do so, we can:

Example 26

Input:

```
1 \instantiate{intmonoid}{monoid}{\mathbb{Z}_{+,0}}[
2     universe = Int ,
3     op = addition ,
4     unit = zero
5 ]
6
7 $\intmonoid{\universe}$, $\intmonoid{\unit}$ and $\intmonoid{\unit}$.
8
9 Also: $\intmonoid!$
```

Output:

```
\mathbb{Z}, 0 and a+b.
Also: \mathbb{Z}_{+,0}
```

\instantiate

So summarizing: \instantiate takes four arguments: The (macro-)name of the instance, a key-value pair assigning declarations in the corresponding mathstructure to symbols currently in scope, the name of the mathstructure to instantiate, and lastly a notation for the instance itself.

It then generates a semantic macro that takes as argument the name of a declaration in the instantiated **mathstructure** and resolves it to the corresponding instance of that particular declaration.

```
\instantiate and mathstructure make use of the Theories-as-Types paradigm

—M→ (see [MRK18]):

—M→ mathstructure{<name>} simply creates a nested theory with name

~T→ <name>-structure. The constant <name> is defined as Mod(<name>-structure)

— a dependent record type with manifest fields, the fields of which are generated
```

```
from (and correspond to) the constants in <name>-structure.

-M-> \instantiate generates a constant whose definiens is a record term of type

Mod(<name>-structure), with the fields assigned based on the respective key-
value-list.
```

Notably, \instantiate throws an error if not every declaration in the instantiated mathstructure is being assigned.

You might consequently ask what the usefulness of mathstructure even is.

\varinstantiate

The answer is that we can also instantiate a mathstructure with a *variable*. The syntax of \varianstantiate is equivalent to that of \instantiate, but all of the key-value-pairs are optional, and if not explicitly assigned (to a symbol *or* a variable declared with \vardef) inherit their notation from the one in the mathstructure environment.

This allows us to do things like:

Example 27

Input:

```
1 \varinstantiate{varM}{monoid}{M}
2
3 A \symname{monoid} is a structure
4 $\varM!:=\mathstruct{\varM{universe},\varM{op}!,\varM{unit}}$
5 such that
6 $\varM{op}!:\funtype{\varM{universe}},\varM{universe}}}\varM{universe}}$
...
```

Output:

```
A monoid is a structure M := \langle U, \circ, e \rangle such that \circ : U \times U \rightarrow U ...
```

and

Example 28

Input:

```
1 \varinstantiate{varMb}{monoid}{M_2}[universe = Int]
2
3 Let $\varMb!:=\mathstruct{\varMb{universe}, \varMb{op}!, \varMb{unit}}$
4 be a \symname{monoid} on $\Int$ ...
```

Output:

```
Let M_2 := \langle \mathbb{Z}, \circ, e \rangle be a monoid on \mathbb{Z} ...
```

We will return to these two example later, when we also know how to handle the axioms of a monoid.

3.4.4The copymodule Environment

TODO: explain

Given modules:

```
Example 29
Input:
   \begin{smodule} {magma}
       \symdef{universe}{\comp{\mathcal U}}
       \symdef{operation}[args=2,op=\circ]{#1 \comp\circ #2}
 4 \end{smodule}
 5 \begin{smodule}{monoid}
       \importmodule{magma}
      \symdef{unit}{\comp e}
 8 \end{smodule}
 9 \begin{smodule}{group}
       \importmodule{monoid}
      \symdef{inverse}[args=1]{{#1}^{\comp{-1}}}
11
12 \end{smodule}
```

Output:

We can form a module for rings by "cloning" an instance of group (for addition) and monoid (for multiplication), respectively, and "glueing them together" to ensure they

```
Example 30
```

share the same universe:

```
Input:
   \begin{smodule}{ring}
       \begin{copymodule} { group} { addition}
 3
          \renamedecl[name=universe] {universe} {runiverse}
          \renamedecl[name=plus]{operation}{rplus}
 5
          \renamedecl[name=zero]{unit}{rzero}
 6
          \renamedecl[name=uminus]{inverse}{ruminus}
 7
      \end{copymodule}
      \notation*{rplus}[plus,op=+,prec=60]{#1 \comp+ #2}
 9
      \notation*{rzero}[zero]{\comp0}
10
      \notation*{ruminus}[uminus,op=-]{\comp- #1}
11
      \begin{copymodule} {monoid} {multiplication}
12
          \assign{universe}{\runiverse}
13
          \renamedecl[name=times] {operation} {rtimes}
14
          \renamedecl[name=one] {unit}{rone}
15
      \end{copymodule}
16
      \notation*{rtimes}[cdot,op=\cdot,prec=50]{#1 \comp\cdot #2}
17
      \notation*{rone}[one]{\comp1}
      Test: \displaystyle \text{Test: } \text{c} \
18
19 \end{smodule}
```

Output:

```
Test: a \cdot (c + d \cdot e)
```

TODO: explain donotclone

3.4.5 The interpretmodule Environment

TODO: explain

```
Example 31
Input:
   \begin{smodule}{int}
       \symdef{Integers}{\comp{\mathbb Z}}
       \symdef{plus}[args=2,op=+]{#1 \comp+ #2}
       \symdef{zero}{\comp0}
       \symdef{uminus}[args=1,op=-]{\comp-#1}
       \begin{interpretmodule}{group}{intisgroup}
           \assign{universe}{\Integers}
          \assign{operation}{\plus!}
          \assign{unit}{\zero}
11
          \assign{inverse}{\uminus!}
       \end{interpretmodule}
13 \end{smodule}
Output:
```

3.5 Primitive Symbols (The STEX Metatheory)

The stex-metatheory package contains STEX symbols so ubiquitous, that it is virtually impossible to describe any flexiformal content without them, or that are required to annotate even the most primitive symbols with meaningful (foundation-independent) "type"-annotations, or required for basic structuring principles (theorems, definitions). As such, it serves as the default meta theory for any STEX module.

We can also see the stex-metatheory as a foundation of mathematics in the sense of [Rab15], albeit an informal one (the ones discussed there are all formal foundations). The state of the stex-metatheory is necessarily incomplete, and will stay so for a long while: It arises as a collection of empirically useful symbols that are collected as more and more mathematics are encoded in STEX and are classified as foundational.

Formal foundations should ideally instantiate these symbols with their formal counterparts, e.g. isa corresponds to a typing operation in typed setting, or the \in -operator in set-theoretic contexts; bind corresponds to a universal quantifier in (nth-order) logic, or a Π in dependent type theories.

We make this theory part of the STeX collection rather than encoding it in STeX itself⁴

EdN:4

⁴EDNOTE: MK: why? continue

Chapter 4

Using STEX Symbols

Given a symbol declaration \symdecl{symbolname}, we obtain a semantic macro \symbolname. We can use this semantic macro in math mode to use its notation(s), and we can use \symbolname! in math mode to use its operator notation(s). What else can we do?

4.1 \symmet and its variants

\symref \symname

We have already seen \symname and \symref, the latter being the more general.

\symref{<symbolname>}{<code>} marks-up <code> as referencing <symbolname>. Since quite often, the <code> should be (a variant of) the name of the symbol anyway, we also have \symname{<symbolname>}.

Note that \symname uses the *name* of a symbol, not its macroname. More precisely, \symname will insert the name of the symbol with "-" replaced by spaces. If a symbol does not have an explicit name= given, the two are equal – but for \symname it often makes sense to make the two explicitly distinct. For example:

Example 32

```
Input:

1 \symdef{Nat}[
2    name=natural-number,
3    type=\set
4 ]{\comp{\mathbb{N}}}
5
6 A \symname{Nat} is...
Output:
```

A natural number is...

\symname takes two additional optional arguments, pre= and post= that get prepended or appended respectively to the symbol name.

\Symname

Additionally, \Symname behaves exactly like \symname, but will capitalize the first letter of the name:

Example 33

Input:

1 \Symname[post=s]{Nat} are...

Output:

Natural numbers are...

This is as good a place as any other to explain how STEX resolves a string symbolname to an actual symbol.

If \symbolname is a semantic macro, then STEX has no trouble resolving symbolname to the full URI of the symbol that is being invoked.

However, especially in \symname (or if a symbol was introduced using \symdecl* without generating a semantic macro), we might prefer to use the *name* of a symbol directly for readability — e.g. we would want to write A \symname{natural-number} is... rather than A \symname{Nat} is... SIEX attempts to handle this case thusly:

If string does *not* correspond to a semantic macro \string and does *not* contain a ?, then STEX checks all symbols currently in scope until it finds one, whose name is string. If string is of the form pre?name, STEX first looks through all modules currently in scope, whose full URI ends with pre, and then looks for a symbol with name name in those. This allows for disambiguating more precisely, e.g. by saying \symname{Integers?addition} or \symname{RealNumbers?addition} in the case where several additions are in scope.

4.2 Marking Up Text and On-the-Fly Notations

We can also use semantic macros outside of text mode though, which allows us to annotate arbitrary text fragments.

Let us assume again, that we have $\symdef{addition}[args=2]{\#1 \comp+ \#2}$. Then we can do

Example 34

Input:

1 \addition{\comp{The sum of} \arg{\$\svar{n}\$} \comp{ and }\arg{\$\svar{m}\$}} 2 is...

Output:

The sum of n and m is...

 \therefore ...which marks up the text fragment as representing an *application* of the addition-symbol to two argument n and m.

Note the difference in treating "arguments" between math mode and text mode. In math mode the (in this case two) tokens/groups following the \addition macro are treated as arguments to the addition function, whereas in text mode the group following \addition is taken to be the ad-hoc presentation. We drill in on this now

\arg

In text mode, every semantic macro takes exactly one argument, namely the text-fragment to be annotated. The \arg command is only valid within the argument to a semantic macro and marks up the *individual arguments* for the symbol.

We can also use semantic macros in text mode to invoke an operator itself instead of its application, with the usual syntax using !:

Example 35

Input:

 $1 \addition!{Addition} is...$

Output:

Addition is...

Indeed, \symbolname! {<code>} is exactly equivalent to \symref {symbolname} {<code>} (the latter is in fact implemented in terms of the former).

\arg also allows us to switch the order of arguments around and "hide" arguments: For example, \arg[3]{<code>} signifies that <code> represents the *third* argument to the current operator, and \arg*[i]{<code>} signifies that <code> represents the *i*th argument, but it should not produce any output (it is exported in the xhtml however, so that MMT and other systems can pick up on it).⁵

Example 36

Input:

- 1 \addition{\comp{adding}
 - \arg[2]{\$\svar{k}\$}
- $3 \qquad \arg*{\$\addition{\svar{n}}{\svar{m}}}} yields..$

Output:

38

 $^{^5\}mathrm{EDNote}\colon$ MK: I do not understand why we have to/want to give the second arg*; I think this must be elaborated on.

```
adding k yields...
```

Note that since the second \arg has no explicit argument number, it automatically represents the first not-yet-given argument – i.e. in this case the first one.

The same syntax can be used in math mod as well. This allows us to spontaneously introduce new notations on the fly. We can activate it using the starred variants of semantic macros:

```
Example 37
Input:

1 Given $\addition{\svar{n}}{\svar{m}}$, then
2 $\addition*{
3 \arg*{\addition{\svar{n}}{\svar{m}}}}
4 \comp{+}
5 \arg{\svar{k}}
6 }$ yields...

Output:

Given n+m, then +k yields...
```

4.3 Referencing Symbols and Statements

TODO: references documentation

EdN:6

 $^{^6\}mathrm{EdNote}$: MK: I do not understand this at all.

Chapter 5

STEX Statements

5.1 Definitions, Theorems, Examples, Paragraphs

As mentioned earlier, we can semantically mark-up *statements* such as definitions, theorems, lemmata, examples, etc.

The corresponding environments for that are:

- sdefinition for definitions,
- sassertion for assertions, i.e. propositions that are declared to be *true*, such as theorems, lemmata, axioms,
- $\bullet\,$ $\,$ $\,$ $\,$ $\,$ $\,$ $\,$ $\,$ $\,$ sexample for examples and counterexamples, and
- sparagraph for "other" semantic paragraphs, such as comments, remarks, conjectures, etc.

The *presentation* of these environments can be customized to use e.g. predefined theorem-environments, see chapter 6 for details.

All of these environments take optional arguments in the form of key=value-pairs. Common to all of them are the keys id= (for cross-referencing, see section 4.3), type= for customization (see chapter 6) and additional information (e.g. definition principles, "difficulty" etc), as well as title= (for giving the paragraph a title), and finally for=.

The for= key expects a comma-separated list of existing symbols, allowing for e.g. things like

Example 38

```
Input:

1 \begin{sexample}[
2    id=additionandmultiplication.ex,
3    for={addition,multiplication},
4    type={trivial,boring},
5    title={An Example}
6]
7    $\addition{2,3}$ is $5$, $\multiplication{2,3}$ is $6$.
8 \end{sexample}
```

Output:

Example 5.1.1 (An Example). 2+3 is 5, $2\cdot 3$ is 6.

\definiendum \definame \Definame

sdefinition (and sparagraph with type=symdoc) introduce three new macros: definiendum behaves like symref (and definame/Definame like symname/Symname, respectively), but highlights the referenced symbol as being defined in the current definition.

\definiens

Additionally, sdefinition (and sparagraph with type=symdoc) introduces \definiens [<optional symbols which marks up <code> as being the explicit definiens of <optional symbols symbols).

All four statement environments – i.e. sdefinition, sassertion, sexample, and sparagraph – also take an optional parameter name= – if this one is given a value, the environment will generate a *symbol* by that name (but with no semantic macro). Not only does this allow for \symmetry merce et al, it allows us to resume our earlier example for monoids much more nicely:⁷

Example 39 Input:

EdN:7

 $^{^7\}mathrm{EdNote}$: MK: we should reference the example explicitly here.

```
\begin{mathstructure} { monoid}
       \symdef{universe}[type=\set]{\comp{U}}}
 2
 3
       \symdef{op}[
 4
          args=2,
 5
          type=\funtype{\universe,\universe}{\universe},
 6
7
          op=\circ
      ]{#1 \comp{\circ} #2}
 8
       \symdef{unit}[type=\universe]{\comp{e}}
10
       \begin{sparagraph}[type=symdoc,for=monoid]
           A \definame{monoid} is a structure
11
12
          $\mathstruct{\universe,\op!,\unit}$
13
           where $\op!:\funtype{\universe}{\universe}$ and
14
           $\inset{\unit}{\universe}$ such that
15
\frac{16}{17}
           \begin{sassertion} [name=associative,
               type=axiom,
18
               title=Associativity]
19
               $\op!$ is associative
20
           \end{sassertion}
           \begin{sassertion} [name=isunit,
21
\overline{22}
               type=axiom,
23
               title=Unit]
24
              \displaystyle {\displaystyle \{ \op{\svar}\{x\}}{\unit}}{\svar}\
25
              for all $\inset{\svar{x}}{\universe}$
26
           \end{sassertion}
27
       \end{sparagraph}
   \end{mathstructure}
30 An example for a \symname{monoid} is..
```

Output:

```
A monoid is a structure \langle U, \circ, e \rangle where \circ : U \rightarrow U and e \in U such that 
Axiom 5.1.2 (Associativity). \circ is associative 
Axiom 5.1.3 (Unit). x \circ e = x for all x \in U 
An example for a monoid is...
```

The main difference to before 8 is that the two sassertions now have name= attributes. Thus the mathstructure monoid now contains two additional symbols, namely the axioms for associativity and that e is a unit. Note that both symbols do not represent the mere propositions that e.g. \circ is associative, but the assertion that it is actually true that \circ is associative.

If we now want to instantiate monoid (unless with a variable, of course), we also need to assign associative and neutral to analogous assertions. So the earlier example

```
1 \instantiate{intmonoid}{monoid}{\mathbb{Z}_{+,0}}[
2    universe = Int ,
3    op = addition ,
4    unit = zero
5 ]
```

EdN:8

⁸EdNote: MK: reference

...will not work anymore. We now need to give assertions that addition is associative and that zero is a unit with respect to addition.²

The stex-proof package supplies macros and environment that allow to annotate the structure of mathematical proofs in STEX document. This structure can be used by MKM systems for added-value services, either directly from the STEX sources, or after translation.

We will go over the general intuition by way of a running example:

```
1 \begin{sproof}[id=simple-proof]
     {We prove that \sum_{i=1}^n{2i-1}=n^{2} by induction over n}
    \begin{spfcases}{For the induction we have to consider three cases:}
     \begin{spfcase}{$n=1$}
      \begin{spfstep}[type=inline] then we compute $1=1^2$\end{spfstep}
     \end{spfcase}
     \begin{spfcase}{$n=2$}
8
        \begin{spfcomment}[type=inline]
9
         This case is not really necessary, but we do it for the
10
          fun of it (and to get more intuition).
11
        \end{spfcomment}
12
        \begin{spfstep}[type=inline] We compute $1+3=2^{2}=4$.\end{spfstep}
13
     \end{spfcase}
     \begin{spfcase}{$n>1$}
14
15
        \begin{spfstep} [type=assumption,id=ind-hyp]
16
         Now, we assume that the assertion is true for a certain $k\geq 1$;
17
          i.e. \sum_{i=1}^k{(2i-1)}=k^{2}.
18
        \end{spfstep}
19
        \begin{spfcomment}
20
          We have to show that we can derive the assertion for $n=k+1$ from
21
          this assumption, i.e. \sum_{i=1}^{k+1}{(2i-1)}=(k+1)^{2}.
        \end{spfcomment}
22
23
        \begin{spfstep}
          We obtain \sum_{i=1}^{k+1}{2i-1}=\sum_{i=1}^k{2i-1}+2(k+1)-1
24
25
          \spfjust[method=arith:split-sum]{by splitting the sum}.
26
        \end{spfstep}
27
        \begin{spfstep}
28
          Thus we have \sum_{i=1}^{k+1}{(2i-1)}=k^2+2k+1
29
          \spfjust[method=fertilize]{by inductive hypothesis}.
30
        \end{spfstep}
31
        \begin{spfstep}[type=conclusion]
32
          We can \spfjust[method=simplify] \{ simplify \} the right-hand side to
33
          {k+1}^2, which proves the assertion.
34
        \end{spfstep}
35
     \end{spfcase}
36
      \begin{spfstep}[type=conclusion]
37
        We have considered all the cases, so we have proven the assertion.
38
      \end{spfstep}
39 \end{spfcases}
40 \end{sproof}
```

This yields the following result:

```
Proof: We prove that \sum_{i=1}^{n} 2i - 1 = n^2 by induction over n
```

²Of course, STEX can not check that the assertions are the "correct" ones – but if the assertions (both in monoid as well as those for addition and zero) are properly marked up, MMT can. TODO: should

- 1. For the induction we have to consider the following cases:
- **1.1.** n = 1: then we compute $1 = 1^2$
- **1.2.** n=2: This case is not really necessary, but we do it for the fun of it (and to get more intuition). We compute $1+3=2^2=4$
- **1.3.** n > 1:
- **1.3.1.** Now, we assume that the assertion is true for a certain $k \geq 1$, i.e. $\sum_{i=1}^k (2i-1) = k^2$.
- **1.3.2.** We have to show that we can derive the assertion for n = k + 1 from this assumption, i.e. $\sum_{i=1}^{k+1} (2i-1) = (k+1)^2$.
- **1.3.3.** We obtain $\sum_{i=1}^{k+1} (2i-1) = \sum_{i=1}^{k} (2i-1) + 2(k+1) 1$ by splitting the sum.
- **1.3.4.** Thus we have $\sum_{i=1}^{k+1} (2i-1) = k^2 + 2k + 1$ by inductive hypothesis.
- **1.3.5.** We can simplify the right-hand side to $(k+1)^2$, which proves the assertion.
- 1.4. We have considered all the cases, so we have proven the assertion.

sproof The sproof environment is the main container for proofs. It takes an optional KeyVal argument that allows to specify the id (identifier) and for (for which assertion is this a

proof) keys. The regular argument of the proof environment contains an introductory comment, that may be used to announce the proof style. The proof environment contains a sequence of spfstep, spfcomment, and spfcases environments that are used to markup the proof steps.

\spfidea

The \spfidea macro allows to give a one-paragraph description of the proof idea.

\spfsketch

For one-line proof sketches, we use the \spfsketch macro, which takes the same optional argument as sproof and another one: a natural language text that sketches the proof.

spfstep

Regular proof steps are marked up with the step environment, which takes an optional KeyVal argument for annotations. A proof step usually contains a local assertion (the text of the step) together with some kind of evidence that this can be derived from already established assertions.

\spfjust

This evidence is marked up with the \spfjust macro in the stex-proofs package. This environment totally invisible to the formatted result; it wraps the text in the proof step that corresponds to the evidence. The environment takes an optional KeyVal argument, which can have the method key, whose value is the name of a proof method (this will only need to mean something to the application that consumes the semantic annotations). Furthermore, the justification can contain "premises" (specifications to assertions that were used justify the step) and "arguments" (other information taken into account by the proof method).

\premise

The \premise macro allows to mark up part of the text as reference to an assertion that is used in the argumentation. In the running example we have used the \premise macro to identify the inductive hypothesis.

\justarg

The \justarg macro is very similar to \premise with the difference that it is used to mark up arguments to the proof method. Therefore the content of the first argument is interpreted as a mathematical object rather than as an identifier as in the case of \premise. In our example, we specified that the simplification should take place on the right hand side of the equation. Other examples include proof methods that instantiate. Here we would indicate the substituted object in a \justarg macro.

Note that both \premise and \justarg can be used with an empty second argument to mark up premises and arguments that are not explicitly mentioned in the text.

subproof

The spfcases environment is used to mark up a subproof. This environment takes an optional KeyVal argument for semantic annotations and a second argument that allows to specify an introductory comment (just like in the proof environment). The method key can be used to give the name of the proof method executed to make this subproof.

 $\operatorname{spf} \operatorname{cases}$

The spfcases environment is used to mark up a proof by cases. Technically it is a variant of the subproof where the method is by-cases. Its contents are spfcase environments that mark up the cases one by one.

 ${\tt spfcase}$

The content of a spfcases environment are a sequence of case proofs marked up in the spfcase environment, which takes an optional KeyVal argument for semantic annotations. The second argument is used to specify the the description of the case under consideration. The content of a spfcase environment is the same as that of a sproof, i.e. spfsteps, spfcomments, and spfcases environments.

\spfcasesketch

\spfcasesketch is a variant of the spfcase environment that takes the same arguments, but instead of the spfsteps in the body uses a third argument for a proof sketch.

spfcomment

The spfcomment environment is much like a step, only that it does not have an object-level assertion of its own. Rather than asserting some fact that is relevant for the proof, it is used to explain where the proof is going, what we are attempting to to, or what we have achieved so far. As such, it cannot be the target of a \premise.

\sproofend

Traditionally, the end of a mathematical proof is marked with a little box at the end of the last line of the proof (if there is space and on the end of the next line if there isn't), like so:

The stex-proofs package provides the \sproofend macro for this.

\sProofEndSymbol

If a different symbol for the proof end is to be used (e.g. q.e.d), then this can be obtained by specifying it using the \sProofEndSymbol configuration macro (e.g. by specifying \sProofEndSymbol{q.e.d}).

Some of the proof structuring macros above will insert proof end symbols for subproofs, in most cases, this is desirable to make the proof structure explicit, but sometimes this wastes space (especially, if a proof ends in a case analysis which will supply its own proof end marker). To suppress it locally, just set proofend={} in them or use use \sProofEndSymbol{}.

Chapter 6

Highlighting and Presentation Customizations

The environments starting with s (i.e. smodule, sassertion, sexample, sdefinition, sparagraph and sproof) by default produce no additional output whatsoever (except for the environment content of course). Instead, the document that uses them (whether directly or e.g. via \inputref) can decide how these environments are supposed to look like.

The stexthm package defines some default customizations that can be used, but of course many existing LaTeX templates come with their own definition, theorem and similar environments that authors are supposed (or even required) to use. Their concrete syntax however is usually not compatible with all the additional arguments that STeX allows for semantic information.

Therefore we introduced the separate environments **sdefinition** etc. instead of using **definition** directly. We allow authors to specify how these environments should be styled via the commands **stexpatch***.

\stexpatchmodule \stexpatchdefinition \stexpatchassertion \stexpatchexample \stexpatchparagraph \stexpatchproof All of these commands take one optional and two proper arguments, i.e. \stexpatch*[<type>]{<begin-code>}{<end-code>}.

After STEX reads and processes the optional arguments for these environments, (some of) their values are stored in the macros \s*field> (i.e. sexampleid, \sassertionname, etc.). It then checks for all the values <type> in the type=-list, whether an \stexpatch*[<type>] for the current environment has been called. If it finds one, it uses the patches
begin-code> and <end-code> to mark up the current environment. If no patch for (any of) the type(s) is found, it checks whether and \stexpatch* was called without optional argument.

For example, if we want to use a predefined theorem environment for sassertions with type=theorem, we can do

1 \stexpatchassertion[theorem] {\begin{theorem}} {\end{theorem}}

...or, rather, since e.g. theorem-like environments defined using amsthm take an optional title as argument, we can do:

- 1 \stexpatchassertion[theorem]
- 2 {\ifx\sassertiontitle\@empty
- 3 \begin{theorem}

```
4 \else
5 \begin{theorem}[\sassertiontitle]
6 \fi}
7 {\end{theorem}}
```

Or, if we want *all kinds of* **sdefinitions** to use a predefined **definition**-environment irrespective of their **type=**, then we can issue the following customization patch:

```
1 \stexpatchdefinition
2 {\ifx\sdefinitiontitle\@empty
3 \begin{definition}
4 \else
5 \begin{definition}[\sdefinitiontitle]
6 \fi}
7 {\end{definition}}
```

\compemph
\varemph
\symrefemph
\defemph

Apart from the environments, we can control how STEX highlights variables, notation components, \symmets and \definiendums, respectively.

To do so, we simply redefine these four macros. For example, to highlight notation components (i.e. everything in a \comp) in blue, as in this document, we can do \def\compemph#1{\textcolor{blue}{#1}}. By default, \compemph et al do nothing.

\compemph@uri \varemph@uri \symrefemph@uri \defemph@uri

For each of the four macros, there exists an additional macro that takes the full URI of the relevant symbol currently being highlighted as a second argument. That allows us to e.g. use pdf tooltips and links. For example, this document uses 9

```
1 \protected\def\symrefemph@uri#1#2{
2 \pdftooltip{
3 \srefsymuri{#2}{\symrefemph{#1}}}
4 }{
5 URI:~\detokenize{#2}
6 }
7 }
```

By default, $\compemph@uri$ is simply defined as $\compemph{\#1}$ (analogously for the other three commands).

Chapter 7

Additional Packages

7.1 Tikzinput: Treating TIKZ code as images

image

The behavior of the ikzinput package is determined by whether the image option is given. If it is not, then the tikz package is loaded, all other options are passed on to it and $\tikzinput{\langle file\rangle}$ inputs the TIKZ file $\langle file\rangle$.tex; if not, only the graphicx package is loaded and $\tikzinput{\langle file\rangle}$ loads an image file $\langle file\rangle$. $\langle ext\rangle$ generated from $\langle file\rangle$.tex.

The selective input functionality of the tikzinput package assumes that the TIKZ pictures are externalized into a standalone picture file, such as the following one

```
1 \documentclass{standalone}
2 \usepackage{tikz}
3 \usetikzpackage{...}
4 \begin{document}
5 \begin{tikzpicture}
6 ...
7 \end{tikzpicture}
8 \end{document}
```

The standalone class is a minimal IATEX class that when loaded in a document that uses the standalone package: the preamble and the documenat environment are disregarded during loading, so they do not pose any problems. In effect, an \input of the file above only sees the tikzpicture environment, but the file itself is standalone in the sense that we can run IATEX over it separately, e.g. for generating an image file from it.

\tikzinput \ctikzinput

This is exactly where the tikzinput package comes in: it supplies the \tikzinput macro, which – depending on the image option – either directly inputs the TIKZ picture (source) or tries to load an image file generated from it.

Concretely, if the image option is not set for the tikzinput package, then $\texttt{tikzinput}[\langle opt \rangle] \{\langle file \rangle\}$ disregards the optional argument $\langle opt \rangle$ and inputs $\langle file \rangle$. tex via linput and resizes it to as specified in the width and height keys. If it is, $\texttt{likzinput}[\langle opt \rangle] \{\langle file \rangle\}$ expands to $\texttt{lincludegraphics}[\langle opt \rangle] \{\langle file \rangle\}$.

\ctizkinput is a version of \tikzinput that is centered.

\mhtikzinput
\cmhtikzinput

\mhtizkinput is a variant of \tikzinput that treats its file path argument as a relative path in a math archive in analogy to \inputref. To give the archive path, we use the mhrepos= key. Again, \cmhtizkinput is a version of \mhtikzinput that is centered.

\libusetikzlibrary

Sometimes, we want to supply archive-specific TIKZ libraries in the lib folder of the archive or the meta-inf/lib of the archive group. Then we need an analogon to \libinput for \usetikzlibrary. The stex-tikzinput package provides the libusetikzlibrary for this purpose.

7.2 Modular Document Structuring

The document-structure package supplies an infrastructure for writing OMDoc documents in IATEX. This includes a simple structure sharing mechanism for STEX that allows to to move from a copy-and-paste document development model to a copy-and-reference model, which conserves space and simplifies document management. The augmented structure can be used by MKM systems for added-value services, either directly from the STEX sources, or after translation.

The document-structure package supplies macros and environments that allow to label document fragments and to reference them later in the same document or in other documents. In essence, this enhances the document-as-trees model to documents-as-directed-acyclic-graphs (DAG) model. This structure can be used by MKM systems for added-value services, either directly from the STEX sources, or after translation. Currently, trans-document referencing provided by this package can only be used in the STEX collection.

DAG models of documents allow to replace the "Copy and Paste" in the source document with a label-and-reference model where document are shared in the document source and the formatter does the copying during document formatting/presentation.

The document-structure package accepts the following options:

$class=\langle name \rangle$	$load \langle name \rangle$.cls instead of article.cls
topsect= $\langle sect \rangle$	The top-level sectioning level; the default for $\langle sect \rangle$ is section

sfragment

The structure of the document is given by nested sfragment environments. In the LATEX route, the sfragment environment is flexibly mapped to sectioning commands, inducing the proper sectioning level from the nesting of sfragment environments. Correspondingly, the sfragment environment takes an optional key/value argument for metadata followed by a regular argument for the (section) title of the sfragment. The optional metadata argument has the keys id for an identifier, creators and contributors for the Dublin Core metadata [DCM03]. The option short allows to give a short title for the generated section. If the title contains semantic macros, they need to be protected by \protect¹⁰, and we need to give the loadmodules key it needs no value. For instance we would have

```
1 \begin{smodule}{foo}
2 \symdef{bar}{B^a_r}
3 ...
4 \begin{sfragment}[id=sec.barderiv,loadmodules]
5 {Introducing $\protect\bar$ Derivations}
```

EdN:10

¹⁰EdNote: MK: still?

 ST_EX automatically computes the sectioning level, from the nesting of sfragment environments.

But sometimes, we want to skip levels (e.g. to use a \subsection* as an introduction for a chapter).

blindfragment

Therefore the document-structure package provides a variant blindfragment that does not produce markup, but increments the sectioning level and logically groups document parts that belong together, but where traditional document markup relies on convention rather than explicit markup. The blindfragment environment is useful e.g. for creating frontmatter at the correct level. The example below shows a typical setup for the outer document structure of a book with parts and chapters.

```
1 \begin{document}
2 \begin{blindfragment}
3 \begin{blindfragment}
4 \begin{frontmatter}
5 \maketitle\newpage
6 \begin{sfragment}{Preface}
  ... <<pre><<pre><<pre><<pre>
8 \end{sfragment}
9 \clearpage\setcounter{tocdepth}{4}\tableofcontents\clearpage
10 \end{frontmatter}
11 \end{blindfragment}
12 ... <<introductory remarks>>
13 \end{blindfragment}
14 \begin{sfragment}{Introduction}
15 ... <<intro>> ...
16 \end{sfragment}
17 ... <<more chapters>> ...
18 \bibliographystyle{alpha}\bibliography{kwarc}
19 \end{document}
```

Here we use two levels of blindfragment:

- The outer one groups the introductory parts of the book (which we assume to have a sectioning hierarchy topping at the part level). This blindfragment makes sure that the introductory remarks become a "chapter" instead of a "part".
- The inner one groups the frontmatter³ and makes the preface of the book a section-level construct.¹¹

\skipfragment

EdN:11

The \skipfragment "skips an sfragment", i.e. it just steps the respective sectioning counter. This macro is useful, when we want to keep two documents in sync structurally, so that section numbers match up: Any section that is left out in one becomes a \skipfragment.

 $^{^3}$ We shied away from redefining the frontmatter to induce a blindfragment, but this may be the "right" way to go in the future.

 $^{^{11}\}mathrm{EDNOTE}$: MK: We need a substitute for the "Note that here the display=flow on the sfragment environment prevents numbering as is traditional for prefaces."

\currentsectionlevel \CurrentSectionLevel

The \currentsectionlevel macro supplies the name of the current sectioning level, e.g. "chapter", or "subsection". \CurrentSectionLevel is the capitalized variant. They are useful to write something like "In this \currentsectionlevel, we will..." in an sfragment environment, where we do not know which sectioning level we will end up.

\prematurestop \afterprematurestop

For prematurely stopping the formatting of a document, STEX provides the \prematurestop macro. It can be used everywhere in a document and ignores all input after that – backing out of the sfragment environment as needed. After that – and before the implicit \end{document} it calls the internal \afterprematurestop, which can be customized to do additional cleanup or e.g. print the bibliography.

\prematurestop is useful when one has a driver file, e.g. for a course taught multiple years and wants to generate course notes up to the current point in the lecture. Instead of commenting out the remaining parts, one can just move the \prematurestop macro. This is especially useful, if we need the rest of the file for processing, e.g. to generate a theory graph of the whole course with the already-covered parts marked up as an overview over the progress; see import_graph.py from the lmhtools utilities [LMH].

Text fragments and modules can be made more re-usable by the use of global variables. For instance, the admin section of a course can be made course-independent (and therefore re-usable) by using variables (actually token registers) <code>courseAcronym</code> and <code>courseTitle</code> instead of the text itself. The variables can then be set in the STEX preamble of the course notes file.

\setSGvar
\useSGvar

 $\sc SGvar \{\langle vname \rangle\} \{\langle text \rangle\}$ to set the global variable $\langle vname \rangle$ to $\langle text \rangle$ and $\sc SGvar \{\langle vname \rangle\}$ to reference it.

\ifSGvar

With\ifSGvar we can test for the contents of a global variable: the macro call \ifSGvar{ $\langle vname \rangle$ }{ $\langle val \rangle$ }{ $\langle ctext \rangle$ } tests the content of the global variable $\langle vname \rangle$, only if (after expansion) it is equal to $\langle val \rangle$, the conditional text $\langle ctext \rangle$ is formatted.

7.3 Slides and Course Notes

The notesslides document class is derived from beamer.cls [Tana], it adds a "notes version" for course notes that is more suited to printing than the one supplied by beamer.cls.

The notesslides class takes the notion of a slide frame from Till Tantau's excellent beamer class and adapts its notion of frames for use in the STEX and OMDoc. To support semantic course notes, it extends the notion of mixing frames and explanatory text, but rather than treating the frames as images (or integrating their contents into the flowing text), the notesslides package displays the slides as such in the course notes to give students a visual anchor into the slide presentation in the course (and to distinguish the different writing styles in slides and course notes).

In practice we want to generate two documents from the same source: the slides for presentation in the lecture and the course notes as a narrative document for home study. To achieve this, the notesslides class has two modes: *slides mode* and *notes mode* which are determined by the package option.

slides notes sectocframes frameimages fiboxed

The notesslides class takes a variety of class options:

- The options slides and notes switch between slides mode and notes mode (see Section ??).
- If the option sectocframes is given, then for the sfragments, special frames with the sfragment title (and number) are generated.
- If the option frameimages is set, then slide mode also shows the \frameimage-generated frames (see section ??). If also the fiboxed option is given, the slides are surrounded by a box.

 ${\tt frame,note}$

Slides are represented with the frame environment just like in the beamer class, see [Tanb] for details. The notesslides class adds the note environment for encapsulating the course note fragments.⁴

Note that it is essential to start and end the notes environment at the start of the line – in particular, there may not be leading blanks – else \LaTeX becomes confused and throws error messages that are difficult to decipher.

By interleaving the frame and note environments, we can build course notes as shown here:

```
1 \ifnotes\maketitle\else
2 \texttt{ [noframe numbering] \ maketitle \ fi}
3
4 \begin{note}
5
    We start this course with ...
6 \end{note}
8 \begin{frame}
9
   \frametitle{The first slide}
10
11 \end{frame}
12 \begin{note}
13 ... and more explanatory text
14 \end{note}
15
16 \begin{frame}
17
    \frametitle{The second slide}
18
19 \end{frame}
```

\ifnotes

Note the use of the \ifnotes conditional, which allows different treatment between notes and slides mode – manually setting \notestrue or \notesfalse is strongly discouraged however.

⁴MK: it would be very nice, if we did not need this environment, and this should be possible in principle, but not without intensive LaTeX trickery. Hints to the author are welcome.

We need to give the title frame the noframenumbering option so that the frame numbering is kept in sync between the slides and the course notes.

The beamer class recommends not to use the allowframebreaks option on frames (even though it is very convenient). This holds even more in the notesslides case: At least in conjunction with \newpage, frame numbering behaves funnily (we have tried to fix this, but who knows).

\inputref*

If we want to transclude a the contents of a file as a note, we can use a new variant \inputref* of the \inputref macro: \inputref*{foo} is equivalent to \begin{note}\inputref{foo}\end{note}.

nexample, nsproof, nassertion

There are some environments that tend to occur at the top-level of note environments. We make convenience versions of these: e.g. the nparagraph environment is just an sparagraph inside a note environment (but looks nicer in the source, since it avoids one level of source indenting). Similarly, we have the nfragment, ndefinition, nexample, nsproof, and nassertion environments.

\setslidelogo

The default logo provided by the notesslides package is the STEX logo it can be customized using $\setslidelogo\{\langle logo\ name \rangle\}$.

\setsource

The default footer line of the notesslides package mentions copyright and licensing. In the beamer class, \source stores the author's name as the copyright holder. By default it is $Michael\ Kohlhase$ in the notesslides package since he is the main user and designer of this package. \setsource{ $\langle name \rangle}$ can change the writer's name.

\setlicensing

For licensing, we use the Creative Commons Attribuition-ShareAlike license by default to strengthen the public domain. If package hyperref is loaded, then we can attach a hyperlink to the license logo. $\ensuremath{\verb|setlicensing[\langle url\rangle]{\langle logo\ name\rangle}}$ is used for customization, where $\langle url\rangle$ is optional.

Sometimes, we want to integrate slides as images after all - e.g. because we already have a PowerPoint presentation, to which we want to add ST_{EX} notes.

\frameimage \mhframeimage

In this case we can use $\frac{\langle opt \rangle}{\langle opt \rangle}$, where $\langle opt \rangle$ are the options of $\frac{\langle opt \rangle}{\langle opt \rangle}$ and $\frac{\langle opt \rangle}{\langle opt \rangle}$ is the file path (extension can be left off like in $\frac{\langle opt \rangle}{\langle opt \rangle}$). We have added the label key that allows to give a frame label that can be referenced like a regular beamer frame.

The $\mbox{mhframeimage}$ macro is a variant of $\mbox{frameimage}$ with repository support. Instead of writing

1 \frameimage{\MathHub{fooMH/bar/source/baz/foobar}}

we can simply write (assuming that \MathHub is defined as above)

1 \mhframeimage[fooMH/bar]{baz/foobar}

Note that the \mhframeimage form is more semantic, which allows more advanced document management features in MathHub.

If baz/foobar is the "current module", i.e. if we are on the MathHub path ...MathHub/fooMH/bar..., then stating the repository in the first optional argument is redundant, so we can just use

1 \mhframeimage{baz/foobar}

\textwarning

The \textwarning macro generates a warning sign:

In course notes, we sometimes want to point to an "excursion" – material that is either presupposed or tangential to the course at the moment – e.g. in an appendix. The typical setup is the following:

- $1 \exp\{\text{founif}\}\{../\text{ex/founif}\}$ We will cover first-order unification in
- 3 \begin{appendix}\printexcursions\end{appendix}

\excursion

The \excursion{ $\langle ref \rangle$ }{ $\langle path \rangle$ }{ $\langle text \rangle$ } is syntactic sugar for

- 1 \begin{nparagraph} [title=Excursion]
- 2 \activateexcursion{founif}{../ex/founif}
- 3 We will cover first-order unification in \sref{founif}.
- 4 \end{nparagraph}

\activateexcursion \printexcursion \excursionref

Here \activateexcursion{ $\langle path \rangle$ } augments the \printexcursions macro by a call \inputref{ $\langle path \rangle$ }. In this way, the \printexcursions macro (usually in the appendix) will collect up all excursions that are specified in the main text.

Sometimes, we want to reference – in an excursion – part of another. We can use $\ensuremath{\texttt{vursionref}} \{\langle label \rangle\}$ for that.

\excursiongroup

Finally, we usually want to put the excursions into an sfragment environment and add an introduction, therefore we provide the a variant of the \printexcursions macro: \excursiongroup[id= $\langle id \rangle$, intro= $\langle path \rangle$] is equivalent to

```
1 \begin{note}
2 \begin{sfragment}[id=<id>]{Excursions}
3 \inputref{<path>}
4 \printexcursions
5 \end{sfragment}
6 \end{note}
```

When option book which uses \pagestyle{headings} is given and semantic macros are given in the sfragment titles, then they sometimes are not defined by the time the heading is formatted. Need to look into how the headings are made. This is a problem of the underlying document-structure package.

7.4 Representing Problems and Solutions

The problem package supplies an infrastructure that allows specify problem. Problems are text fragments that come with auxiliary functions: hints, notes, and solutions⁵. Furthermore, we can specify how long the solution to a given problem is estimated to take and how many points will be awarded for a perfect solution.

Finally, the problem package facilitates the management of problems in small files, so that problems can be re-used in multiple environment.

solutions notes hints gnotes pts min boxed test

The problem package takes the options solutions (should solutions be output?), notes (should the problem notes be presented?), hints (do we give the hints?), gnotes (do we show grading notes?), pts (do we display the points awarded for solving the problem?), min (do we display the estimated minutes for problem soling). If theses are specified, then the corresponding auxiliary parts of the problems are output, otherwise, they remain invisible.

The boxed option specifies that problems should be formatted in framed boxes so that they are more visible in the text. Finally, the test option signifies that we are in a test situation, so this option does not show the solutions (of course), but leaves space for the students to solve them.

problem

The main environment provided by the problempackage is (surprise surprise) the problem environment. It is used to mark up problems and exercises. The environment takes an optional KeyVal argument with the keys id as an identifier that can be reference later, pts for the points to be gained from this exercise in homework or quiz situations, min for the estimated minutes needed to solve the problem, and finally title for an informative title of the problem.

 $^{^{5}}$ for the moment multiple choice problems are not supported, but may well be in a future version

Example 40

Input:

```
\documentclass{article}
 2 \usepackage[solutions,hints,pts,min]{problem}
 3 \begin{document}
    \begin{sproblem}[id=elefants,pts=10,min=2,title=Fitting Elefants]
How many Elefants can you fit into a Volkswagen beetle?
         Think positively, this is simple!
       \end{hint}
       \begin{exnote}
10
         Justify your answer
       \end{exnote}
11
   \begin{solution} [for=elefants, height=3cm]
12
    Four, two in the front seats, and two in the back.
    \begin{gnote}
       if they do not give the justification deduct 5 pts
16
   \end{gnote}
17 \end{solution}
18 \end{sproblem}
19 \end{document}
```

Output:

Problem 7.4.1 (Fitting Elefants) How many Elefants can you fit into a Volkswagen beetle? Hint: Think positively, this is simple! Note: Justify your answer Solution: Four, two in the front seats, and two in the back. Grading: if they do not give the justification deduct 5 pts

solution

The solution environment can be to specify a solution to a problem. If the package option solutions is set or \solutionstrue is set in the text, then the solution will be presented in the output. The solution environment takes an optional KeyVal argument with the keys id for an identifier that can be reference for to specify which problem this is a solution for, and height that allows to specify the amount of space to be left in test situations (i.e. if the test option is set in the \usepackage statement).

hint, exnote, gnote

The hint and exnote environments can be used in a problem environment to give hints and to make notes that elaborate certain aspects of the problem. The gnote (grading notes) environment can be used to document situations that may arise in grading.

\startsolutions \stopsolutions

Sometimes we would like to locally override the solutions option we have given to the package. To turn on solutions we use the \startsolutions, to turn them off, \stopsolutions. These two can be used at any point in the documents.

\ifsolutions

Also, sometimes, we want content (e.g. in an exam with master solutions) conditional on whether solutions are shown. This can be done with the \ifsolutions conditional.

mcb Multiple choice blocks can be formatted using the mcb environment, in which single choices are marked up with \mcc macro.

 \mcc

 $\mbox{\colored} \langle keyvals \rangle \mbox{\colored} \langle text \rangle \mbox{\colored}$ takes an optional key/value argument $\langle keyvals \rangle$ for choice metadata and a required argument $\langle text \rangle$ for the proposed answer text. The following keys are supported

- T for true answers, F for false ones,
- Ttext the verdict for true answers, Ftext for false ones, and
- feedback for a short feedback text given to the student.

If we start the solutions, then we get

Example 41

Input:

```
1 \startsolutions
2 \begin{sproblem}[title=Functions,name=functions1]
3 What is the keyword to introduce a function definition in python?
4 \begin{mcb}
5 \mcc[T]{def}
6 \mcc[F,feedback=that is for C and C++]{function}
7 \mcc[F,feedback=that is for Standard ML]{fun}
8 \mcc[F,Ftext=Noooooooooo,feedback=that is for Java]{public static void}
9 \end{mcb}
10 \end{sproblem}
```

Output:

Problem 7.4.2 (Functions) What is the keyword to intro

What is the keyword to introduce a function definition in python?

- □ def (true)□ function (false) (that is for C and C++)
- ☐ fun (false) (that is for Standard ML)
- □ public static void (false) (that is for Java)

(laise) (that is jor Java

without solutions (that is what the students see during the exam/quiz) 12

 $^{^{12}\}mathrm{EdNote}$: MK: that did not work!

Example 42

Input:

```
1 \stopsolutions
2 \begin{sproblem}[title=Functions,name=functions1]
3 What is the keyword to introduce a function definition in python?
4 \begin{mcb}
5 \mcc[T]{def}
6 \mcc[F,feedback=that is for C and C++]{function}
7 \mcc[F,feedback=that is for Standard ML]{fun}
8 \mcc[F,Ftext=Noooooooooo,feedback=that is for Java]{public static void}
9 \end{mcb}
10 \end{sproblem}
```

Output:

```
Problem 7.4.3 (Functions)

What is the keyword to introduce a function definition in python?

def
(true)

function
(false) (that is for C and C++)

fun
(false) (that is for Standard ML)

public static void
(false) (that is for Java)
```

\includeproblem

The \includeproblem macro can be used to include a problem from another file. It takes an optional KeyVal argument and a second argument which is a path to the file containing the problem (the macro assumes that there is only one problem in the include file). The keys title, min, and pts specify the problem title, the estimated minutes for solving the problem and the points to be gained, and their values (if given) overwrite the ones specified in the problem environment in the included file.

The sum of the points and estimated minutes (that we specified in the pts and min keys to the problem environment or the \includeproblem macro) to the log file and the screen after each run. This is useful in preparing exams, where we want to make sure that the students can indeed solve the problems in an allotted time period.

The \min and \pts macros allow to specify (i.e. to print to the margin) the distribution of time and reward to parts of a problem, if the pts and pts options are set. This allows to give students hints about the estimated time and the points to be awarded.

7.5 Homeworks, Quizzes and Exams

The hwexam package and class supplies an infrastructure that allows to format nice-looking assignment sheets by simply including problems from problem files marked up

with the roblem package. It is designed to be compatible with problems.sty, and inherits some of the functionality.

solutions notes hints gnotes pts min The wexam package and class take the options solutions, notes, hints, gnotes, pts, min, and boxed that are just passed on to the problems package (cf. its documentation for a description of the intended behavior).

assignment number

title type given due multiple This package supplies the assignment environment that groups problems into assignment sheets. It takes an optional KeyVal argument with the keys number (for the assignment number; if none is given, 1 is assumed as the default or — in multi-assignment documents — the ordinal of the assignment environment), title (for the assignment title; this is referenced in the title of the assignment sheet), type (for the assignment type; e.g. "quiz", or "homework"), given (for the date the assignment was given), and due (for the date the assignment is due).

Furthermore, the hwexam package takes the option multiple that allows to combine multiple assignment sheets into a compound document (the assignment sheets are treated as section, there is a table of contents, etc.).

test

Finally, there is the option test that modifies the behavior to facilitate formatting tests. Only in test mode, the macros \testspace, \testnewpage, and \testemptypage have an effect: they generate space for the students to solve the given problems. Thus they can be left in the LATEX source.

\testspace \testnewpage \testemptypage \testspace takes an argument that expands to a dimension, and leaves vertical space accordingly. \testnewpage makes a new page in test mode, and \testemptypage generates an empty page with the cautionary message that this page was intentionally left empty.

testheading duration min Finally, the \testheading takes an optional keyword argument where the keys duration specifies a string that specifies the duration of the test, min specifies the equivalent in number of minutes, and reqpts the points that are required for a perfect grade.

reqpts

- 1 \title{320101 General Computer Science (Fall 2010)}
- 2 \begin{testheading} [duration=one hour,min=60,reqpts=27]
- 3 Good luck to all students!
- 4 \end{testheading}

Will result in

Name:

Matriculation Number:

320101 General Computer Science (Fall 2010)

2022-05-21

You have one hour (sharp) for the test;

Write the solutions to the sheet.

The estimated time for solving this exam is 60 minutes, leaving you 0 minutes for revising your exam.

You can reach 40 points if you solve all problems. You will only need 27 points for a perfect score, i.e. 13 points are bonus points.

You have ample time, so take it slow and avoid rushing to mistakes!

Different problems test different skills and knowledge, so do not get stuck on one problem.

			J									
	To be used for grading, do not write here											
prob.	7.4.1	7.4.2	7.4.3	1.1	2.1	2.2	2.3	3.1	3.2	3.3	Sum	grade
total	10			4	4	6	6	4	4	2	40	
reached												

good luck

13

\inputassignment

EdN:13

The \inputassignment macro can be used to input an assignment from another file. It takes an optional KeyVal argument and a second argument which is a path to the file containing the problem (the macro assumes that there is only one assignment environment in the included file). The keys number, title, type, given, and due are just as for the assignment environment and (if given) overwrite the ones specified in the assignment environment in the included file.

 $^{^{-13}\}mathrm{EdNote}$: MK: The first three "problems" come from the stex examples above, how do we get rid of this?

Part II Documentation

Chapter 8

STEX-Basics

This sub package provides general set up code, auxiliary methods and abstractions for xhtml annotations.

8.1 Macros and Environments

\sTeX Both print this STeX logo.

\stex_debug:nn

 $\stex_debug:nn {\langle log-prefix \rangle} {\langle message \rangle}$

Logs $\langle message \rangle$, if the package option debug contains $\langle log\text{-}prefix \rangle$.

8.1.1 HTML Annotations

\if@latexml

LATEXATE Conditional for LATEXML

 LATEXX3 conditionals for LATEXML.

 $\stex_if_do_html_p: \star \\ stex_if_do_html: \underline{\mathit{TF}} \star \\$

Whether to currently produce any HTML annotations (can be false in some advanced structuring environments, for example)

\stex_suppress_html:n

Temporarily disables HTML annotations in its argument code

We have four macros for annotating generated HTML (via LaTeXML or $R_{US}T_{E\!\!\!\!/}X)$ with attributes:

Annotates the HTML generated by $\langle content \rangle$ with

behaves like $\stex_annotate:nnn \{\langle property \rangle\} \{\langle resource \rangle\} \{\langle content \rangle\}.$

stex_annotate_env

8.1.2 Babel Languages

```
\c_stex_languages_prop
\c_stex_language_abbrevs_prop
```

Map language abbreviations to their full babel names and vice versa. e.g. \c_stex_languages_prop{en} yields english, and \c_stex_language_abbrevs_prop{english} yields en.

8.1.3 Auxiliary Methods

\stex_deactivate_macro:Nn \stex_reactivate_macro:N

 $\verb|\stex_deactivate_macro:Nn| \langle cs \rangle \{ \langle environments \rangle \}|$

Makes the macro $\langle cs \rangle$ throw an error, indicating that it is only allowed in the context of $\langle environments \rangle$.

 $\scalebox{stex_reactivate_macro:} \mathbb{N}\langle cs \rangle$ reactivates it again, i.e. this happens ideally in the $\langle begin \rangle$ -code of the associated environments.

\ignorespacesandpars

ignores white space characters and \par control sequences. Expands tokens in the process.

Chapter 9

STEX-MathHub

This sub package provides code for handling STEX archives, files, file paths and related methods.

9.1 Macros and Environments

\stex_kpsewhich:n

\stex_kpsewhich:n executes kpsewhich and stores the return in \l_stex_kpsewhich_return_str. This does not require shell escaping.

9.1.1 Files, Paths, URIs

\stex_path_from_string:Nn

 $\stex_path_from_string:Nn \langle path-variable \rangle \{\langle string \rangle\}$

turns the $\langle string \rangle$ into a path by splitting it at /-characters and stores the result in $\langle path-variable \rangle$. Also applies $\text{stex_path_canonicalize:N}$.

\stex_path_to_string:NN \stex_path_to_string:N

The inverse; turns a path into a string and stores it in the second argument variable, or leaves it in the input stream.

\stex_path_canonicalize:N

Canonicalizes the path provided; in particular, resolves . and .. path segments.

 $\stex_path_if_absolute_p:N \star \\stex_path_if_absolute:NTF \star$

Checks whether the path provided is absolute, i.e. starts with an empty segment

\c_stex_pwd_seq
\c_stex_pwd_str
\c_stex_mainfile_seq
\c_stex_mainfile_str

Store the current working directory as path-sequence and string, respectively, and the (heuristically guessed) full path to the main file, based on the PWD and \jobname.

\g_stex_currentfile_seq

The file being currently processed (respecting \input etc.)

\stex_filestack_push:n
\stex_filestack_pop:

Push and pop (repsectively) a file path to the file stack, to keep track of the current file. Are called in hooks file/before and file/after, respectively.

9.1.2 MathHub Archives

\mathhub
\c_stex_mathhub_seq
\c_stex_mathhub_str

We determine the path to the local MathHub folder via one of four means, in order of precedence:

- 1. The mathhub package option, or
- 2. the \mathhub-macro, if it has been defined before the \usepackage{stex}-statement, or
- 3. the MATHHUB system variable, or
- 4. a path specified in ~/.stex/mathhub.path.

In all four cases, \c_stex_mathhub_seq and \c_stex_mathhub_str are set accordingly.

\l_stex_current_repository_prop

Always points to the *current* MathHub repository (if we currently are in one). Has the following fields corresponding to the entries in the MANIFEST.MF-file:

id: The name of the archive, including its group (e.g. smglom/calculus),

ns: The content namespace (for modules and symbols),

narr: the narration namespace (for document references),

docur1: The URL that is used as a basis for external references,

deps: All archives that this archive depends on (currently not in use).

\stex_set_current_repository:n

Sets the current repository to the one with the provided ID. calls __stex_mathhub_-do_manifest:n, so works whether this repository's MANIFEST.MF-file has already been read or not.

\stex_require_repository:n

Calls __stex_mathhub_do_manifest:n iff the corresponding archive property list does not already exist, and adds a corresponding definition to the .sms-file.

\stex_in_repository:nn

 $\stex_in_repository:nn{\langle repository-name \rangle}{\langle code \rangle}$

Change the current repository to $\{\langle repository-name \rangle\}$ (or not, if $\{\langle repository-name \rangle\}$ is empty), and passes its ID on to $\{\langle code \rangle\}$ as #1. Switches back to the previous repository after executing $\{\langle code \rangle\}$.

9.1.3 Using Content in Archives

\mhpath *

 $\mathbf{Archive} - ID$ ${\langle filename \rangle}$

Expands to the full path of file $\langle filename \rangle$ in repository $\langle archive\text{-}ID \rangle$. Does not check whether the file or the repository exist.

\inputref \mhinput

 $\inputref[\langle archive-ID \rangle] \{\langle filename \rangle\}$

Both \input the file $\langle filename \rangle$ in archive $\langle archive\text{-}ID \rangle$ (relative to the source-subdirectory). \mhinput does so directly. \inputref does so within an \begingroup...\endgroup-block, and skips it in html-mode, inserting a reference to the file instead.

Both also set \ifinputref to true.

\addmhbibresource

 $\displaystyle \left[\langle archive-ID \rangle \right] \left\{ \langle filename \rangle \right\}$

Adds a .bib-file $\langle filename \rangle$ in archive $\langle archive\text{-}ID \rangle$ (relative to the top-directory of the archive!).

\libinput

 $\left\langle filename \right\rangle$

Inputs $\langle filename \rangle$.tex from the lib folders in the current archive and the meta-infarchive of the current archive group(s) (if existent) in descending order. Throws an error if no file by that name exists in any of the relevant lib-folders.

\libusepackage

 $\label{libusepackage} \label{libusepackage} $$ \left(args \right) \left(filename \right) \right) $$$

Like \libinput, but looks for .sty-files and calls \usepackage[\meta{args}]\Arg{filename} instead of \input.

Throws an error, if none or more than one suitable package file is found.

\mhgraphics \cmhgraphics

If the graphicx package is loaded, these macros are defined at \begin{document}.

\mhgraphics takes the same arguments as \includegraphics, with the additional optional key mhrepos. It then resolves the file path in \mhgraphics[mhrepos=Foo/Bar]{foo/bar.png} relative to the source-folder of the Foo/Bar-archive.

\cmhgraphics additional wraps the image in a center-environment.

\lstinputmhlisting \clstinputmhlisting Like \mhgraphics, but only defined if the listings-package is loaded, and with \lstinputlisting instead of \includegraphics.

STEX-References

This sub package contains code related to links and cross-references

10.1 Macros and Environments

\STEXreftitle

 $\STEXreftitle{\langle some \ title \rangle}$

Sets the title of the current document to $\langle some\ title \rangle$. A reference to the current document from $some\ other$ document will then be displayed accordingly. e.g. if \STEXreftitle{foo book} is called, then referencing Definition 3.5 in this document in another document will display Definition 3.5 in foo book.

\stex_get_document_uri:

Computes the current document uri from the current archive's narr-field and its location relative to the archive's source-directory. Reference targets are computed from this URI and the reference-id.

\l_stex_current_docns_str

Stores its result in \1 stex current docns str

\stex_get_document_url:

Computes the current URL from the current archive's docurl-field and its location relative to the archive's source-directory. Reference targets are computed from this URL and the reference-id, if this document is only included in SMS mode.

\l_stex_current_docurl_str

Stores its result in \l_stex_current_docurl_str

10.1.1 Setting Reference Targets

\stex_ref_new_doc_target:n

 $\stex_ref_new_doc_target:n{\langle id \rangle}$

Sets a new reference target with id $\langle id \rangle$.

\stex_ref_new_sym_target:n

 $\stex_ref_new_sym_target:n{\langle uri \rangle}$

Sets a new reference target for the symbol $\langle uri \rangle$.

10.1.2 Using References

\sref

 $\ \left[\left\langle opt-args\right\rangle \right]\left\{\left\langle id\right\rangle \right\}$

References the label with if $\langle id \rangle$. Optional arguments: TODO

\srefsym

 $\scalebox{$\scalebox{\sim} (opt-args)]{$\scalebox{$\sim$}}}$

Like \sref, but references the *canonical label* for the provided symbol. The canonical target is the last of the following occurring in the document:

- A \definiendum or \definame for $\langle symbol \rangle$,
- The sassertion, sexample or sparagraph with for= $\langle symbol \rangle$ that generated $\langle symbol \rangle$ in the first place, or
- A \sparagraph with type=symdoc and for= $\langle symbol \rangle$.

\srefsymuri

 $\verb|\srefsymuri{|\langle \mathit{URI} \rangle|} {\langle \mathit{text} \rangle}|$

A convenient short-hand for \srefsym[linktext={text}]{URI}, but requires the first argument to be a full URI already. Intended to be used in e.g. \compemph@uri, \defemph@uri, etc.

STEX-Modules

This sub package contains code related to Modules

11.1 Macros and Environments

The content of a module with uri $\langle <URI>\rangle$ is stored in four macros. All modifications of these macros are global:

\c_stex_module_<URI>_prop

A property list with the following fields:

name The name of the module,

ns the namespace in field ns,

file the file containing the module, as a sequence of path fragments

lang the module's language,

sig the language of the signature module, if the current file is a translation from some other language,

deprecate if this module is deprecated, the module that replaces it,

meta the metatheory of the module.

\c_stex_module_<URI>_code

The code to execute when this module is activated (i.e. imported), e.g. to set all the semantic macros, notations, etc.

\c_stex_module_<URI>_constants

The names of all constants declared in the module

\c_stex_module_<URI>_constants

The full URIs of all modules imported in this module

\l_stex_current_module_str

\l_stex_current_module_str always contains the URI of the current module (if existent).

\l_stex_all_modules_seq

Stores full URIs for all modules currently in scope.

\stex_if_in_module_p: *

Conditional for whether we are currently in a module

 $\stex_if_in_module: \underline{TF} \star$

\stex_if_module_exists_p:n *

 $\stex_if_module_exists:n_{\overline{TF}} \star$

Conditional for whether a module with the provided URI is already known.

\stex_add_to_current_module:n
\STEXexport

Adds the provided tokens to the _code control sequence of the current module. \stex_add_to_current_module:n is used internally, \STEXexport is intended for users and additionally executes the provided code immediately.

\stex_add_constant_to_current_module:n

Adds the declaration with the provided name to the **_constants** control sequence of the current module.

\stex_add_import_to_current_module:n

Adds the module with the provided full URI to the _imports control sequence of the current module.

\stex_collect_imports:n

Iterates over all imports of the provided (full URI of a) module and stores them as a topologically sorted list – including the provided module as the last element – in \l_stex_collect_imports_seq

\stex_do_up_to_module:n

Code that is exported from module (such as symbol declarations) should be local to the current module. For that reason, ideally all symbol declarations and similar commands should be called directly in the module environment, however, that is not always feasible, e.g. in structural features or sparapraphs. \stex_do_up_to_module therefore executes the provided code repeatedly in an \aftergroup up until the group level is equal to that of the innermost smodule environment.

\stex_modules_current_namespace:

Computes the current namespace as follows:

If the current file is .../source/sub/file.tex in some archive with namespace http://some.namespace/foo, then the namespace of is http://some.namespace/foo/sub/file. Otherwise, the namespace is the absolute file path of the current file (i.e. starting with file:///).

The result is stored in \l_stex_module_ns_str. Additionally, the sub path relative to the current repository is stored in \l_stex_module_subpath_str.

11.1.1 The smodule environment

module $\lceil \pmod{module} \lceil \langle options \rangle \rceil \{\langle name \rangle \}$

Opens a new module with name $\langle name \rangle$. Options are:

title $(\langle token \ list \rangle)$ to display in customizations.

type $(\langle string \rangle *)$ for use in customizations.

deprecate $(\langle module \rangle)$ if set, will throw a warning when loaded, urging to use $\langle module \rangle$ instead.

id $(\langle string \rangle)$ for cross-referencing.

ns $(\langle URI \rangle)$ the namespace to use. Should not be used, unless you know precisely what you're doing. If not explicitly set, is computed using $\text{stex_modules_current_namespace}$:

lang $(\langle language \rangle)$ if not set, computed from the current file name (e.g. foo.en.tex).

sig (\language\rangle) if the current file is a translation of a file with the same base name but a different language suffix, setting sig=<lang> will preload the module from that language file. This helps ensuring that the (formal) content of both modules is (almost) identical across languages and avoids duplication.

creators ($\langle string \rangle *$) names of the creators.

contributors ($\langle string \rangle *$) names of contributors.

srccite $(\langle string \rangle)$ a source citation for the content of this module.

\stex_module_setup:nn

 $\stex_module_setup:nn{\langle params \rangle}{\langle name \rangle}$

Sets up a new module with name $\langle name \rangle$ and optional parameters $\langle params \rangle$. In particular, sets \l_stex_current_module_str appropriately.

\stexpatchmodule

\stexpatchmodule $[\langle type \rangle]$ { $\langle begincode \rangle$ } { $\langle endcode \rangle$ }

Customizes the presentation for those smodule-environments with type= $\langle type \rangle$, or all others if no $\langle type \rangle$ is given.

\STEXModule

 $\STEXModule \{\langle fragment \rangle\}$

Attempts to find a module whose URI ends with $\langle fragment \rangle$ in the current scope and passes the full URI on to $stex_invoke_module:n$.

\stex_invoke_module:n

Invoked by \STEXModule. Needs to be followed either by !\macro or ?{ $\langle symbolname \rangle$ }. In the first case, it stores the full URI in \macro; in the second case, it invokes the symbol $\langle symbolname \rangle$ in the selected module.

 $\verb|\stex_activate_module:n| \\$

Activate the module with the provided URI; i.e. executes all macro code of the module's <code>_code-</code>macro (does nothing if the module is already activated in the current context) and adds the module to <code>\l_stex_all_modules_seq</code>.

STeX-Module Inheritance

Code related to Module Inheritance, in particular sms mode.

12.1 Macros and Environments

12.1.1 SMS Mode

"SMS Mode" is used when loading modules from external tex files. It deactivates any output and ignores all TEX commands not explicitly allowed via the following lists – all of which either declare module content or are needed in order to declare module content:

$\g_stex_smsmode_allowedmacros_tl$

Macros that are executed as is; i.e. sms mode continues immediately after. These macros may not take any arguments or otherwise gobble tokens.

 $Initially: \verb|\makeatletter|, \verb|\makeatother|, \verb|\ExplSyntaxOn|, \verb|\ExplSyntaxOff|.$

$\verb|\g_stex_smsmode_allowedmacros_escape_tl|\\$

Macros that are executed and potentially gobble up further tokens. These macros need to make sure, that the very last token they ultimately expand to is \stex_smsmode_do:.

Initially: \symdecl, \notation, \symdef, \importmodule, \STEXexport, \inlineass, \inlinedef, \inlineex, \endinput, \setnotation, \copynotation.

$\g_stex_smsmode_allowedenvs_seq$

The names of environments that should be allowed in SMS mode. The corresponding \begin-statements are treated like the macros in \g_stex_smsmode_allowedmacros_-escape_tl, so \stex_smsmode_do: needs to be the last token in the \begin-code. Since \end-statements take no arguments anyway, those are called directly and sms mode continues afterwards.

 $Initially: \verb|smodule|, copymodule|, interpretmodule|, \verb|sdefinition|, sexample|, \verb|sassertion|, sparagraph|.$

\stex_if_smsmode_p: *
\stex_if_smsmode:TF *

Tests whether SMS mode is currently active.

\stex_file_in_smsmode:nn

 $\stex_in_smsmode:nn {\langle filename \rangle} {\langle code \rangle}$

Executes $\langle code \rangle$ in SMS mode, followed by the content of $\langle filename \rangle$. $\langle code \rangle$ can be used e.g. to set the current repository, and is executed within a new tex group, and the same group as the file content.

\stex_smsmode_do:

Starts gobbling tokens until one is encountered that is allowed in SMS mode.

12.1.2 Imports and Inheritance

\importmodule

 $\verb|\importmodule[\langle archive-ID \rangle] {\langle module-path \rangle}|$

Imports a module by reading it from a file and "activating" it. STEX determines the module and its containing file by passing its arguments on to \stex_import_module_-path:nn.

\usemodule

 $\verb|\importmodule[|\langle archive-ID\rangle]| = \{|\langle module-path\rangle|\}$

Like \importmodule, but does not export its contents; i.e. including the current module will not activate the used module

 $\stex_import_module_uri:nn {\langle archive-ID \rangle} {\langle module-path \rangle}$

Determines the URI of a module by splitting $\langle module\text{-}path \rangle$ into $\langle path \rangle$? $\langle name \rangle$. If $\langle module\text{-}path \rangle$ does not contain a ?-character, we consider it to be the $\langle name \rangle$, and $\langle path \rangle$ to be empty.

If $\langle archive\text{-}ID \rangle$ is empty, it is automatically set to the ID of the current archive (if one exists).

1. If $\langle archive\text{-}ID \rangle$ is empty:

(a) If $\langle path \rangle$ is empty, then $\langle name \rangle$ must have been declared earlier in the same file and retrievable from \g_stex_modules_in_file_seq, or a file with name $\langle name \rangle . \langle lang \rangle$.tex must exist in the same folder, containing a module $\langle name \rangle$.

That module should have the same namespace as the current one.

(b) If $\langle path \rangle$ is not empty, it must point to the relative path of the containing file as well as the namespace.

2. Otherwise:

(a) If $\langle path \rangle$ is empty, then $\langle name \rangle$ must have been declared earlier in the same file and retrievable from $\g_stex_modules_in_file_seq$, or a file with name $\langle name \rangle . \langle lang \rangle . tex$ must exist in the top source folder of the archive, containing a module $\langle name \rangle$.

That module should lie directly in the namespace of the archive.

(b) If \(\rangle path \rangle\) is not empty, it must point to the path of the containing file as well as the namespace, relative to the namespace of the archive.

If a module by that namespace exists, it is returned. Otherwise, we call \stex_require_module:nn on the source directory of the archive to find the file.

\l_stex_import_name_str
\l_stex_import_archive_str
\l_stex_import_path_str
\l_stex_import_ns_str

stores the result in these four variables.

 $\stex_import_require_module:nnnn = {\langle ns \rangle} {\langle archive-ID \rangle} {\langle path \rangle} {\langle name \rangle}$

Checks whether a module with URI $\langle ns \rangle$? $\langle name \rangle$ already exists. If not, it looks for a plausible file that declares a module with that URI.

Finally, activates that module by executing its _code-macro.

STEX-Symbols

Code related to symbol declarations and notations

13.1 Macros and Environments

\symdecl

 $\symdecl{\langle macroname \rangle}[\langle args \rangle]$

Declares a new symbol with semantic macro \macroname. Optional arguments are:

- name: An (OMDoc) name. By default equal to $\langle macroname \rangle$.
- type: An (ideally semantic) term, representing a type. Not used by SIEX, but passed on to MMT for semantic services.
- def: An (ideally semantic) term, representing a definiens. Not used by STEX, but passed on to MMT for semantic services.
- local: A boolean (by default false). If set, this declaration will not be added to the module content, i.e. importing the current module will not make this declaration available.
- args: Specifies the "signature" of the semantic macro. Can be either an integer $0 \le n \le 9$, or a (more precise) sequence of the following characters:
 - i a "normal" argument, e.g. \symdecl{plus}[args=ii] allows for \plus{2}{2}.
 - a an associative argument; i.e. a sequence of arbitrarily many arguments provided as a comma-separated list, e.g. \symdecl{plus}[args=a] allows for \plus{2,2,2}.
 - b a variable argument. Is treated by STEX like an i-argument, but an application is turned into an OMBind in OMDoc, binding the provided variable in the subsequent arguments of the operator; e.g. \symdecl{forall}[args=bi] allows for \forall{x\in\Nat}{x\geq0}.

\stex_symdecl_do:n

Implements the core functionality of \symdecl, and is called by \symdecl and \symdef. Ultimately stores the symbol $\langle URI \rangle$ in the property list \l_stex_symdecl_ $\langle URI \rangle$ _prop with fields:

- name (string),
- module (string),
- notations (sequence of strings; initially empty),
- local (boolean),
- type (token list),
- args (string of is, as and bs),
- arity (integer string),
- assocs (integer string; number of associative arguments),

\stex_all_symbols:n

Iterates over all currently available symbols. Requires two \seq_map_break: to break fully.

\stex_get_symbol:n

Computes the full URI of a symbol from a macro argument, e.g. the macro name, the macro itself, the full URI...

\notation

 $\notation[\langle args \rangle] \{\langle symbol \rangle\} \{\langle notations^+ \rangle\}$

Introduces a new notation for $\langle symbol \rangle$, see \stex_notation_do:nn

\stex_notation_do:nn

 $\stex_notation_do:nn\{\langle \mathit{URI}\rangle\}\{\langle notations^+\rangle\}$

Implements the core functionality of \notation , and is called by \notation and \symdef .

Ultimately stores the notation in the property list $\g_stex_notation_{\URI}\#\langle variant\rangle\#\langle lang\rangle_{\prop}$ with fields:

- symbol (URI string),
- language (string),
- variant (string),
- opprec (integer string),
- argprecs (sequence of integer strings)

\symdef

 $\symdef[\langle args \rangle] \{\langle symbol \rangle\} \{\langle notations^+ \rangle\}$

Combines \symdecl and \notation by introducing a new symbol and assigning a new notation for it.

ST_EX-Terms

Code related to symbolic expressions, typesetting notations, notation components, etc.

14.1 Macros and Environments

\STEXsymbol

Uses \stex_get_symbol:n to find the symbol denoted by the first argument and passes the result on to \stex_invoke_symbol:n

\symref

 $\symref{\langle symbol \rangle} {\langle text \rangle}$

shortcut for $\STEXsymbol{\langle symbol \rangle}! [\langle text \rangle]$

\stex_invoke_symbol:n

Executes a semantic macro. Outside of math mode or if followed by *, it continues to \stex_term_custom:nn. In math mode, it uses the default or optionally provided notation of the associated symbol.

If followed by !, it will invoke the symbol *itself* rather than its application (and continue to \stex_term_custom:nn), i.e. it allows to refer to \plus![addition] as an operation, rather than \plus[addition of]{some}{terms}.

\STEXInternalTermMathOMSiiii \(\text{UI} \)

\STEXInternalTermMathOMBiiii

 $\langle \mathit{URI} \rangle \langle \mathit{fragment} \rangle \langle \mathit{precedence} \rangle \langle \mathit{body} \rangle$

Annotates $\langle body \rangle$ as an OMDoc-term (OMID, OMA or OMBIND, respectively) with head symbol $\langle URI \rangle$, generated by the specific notation $\langle fragment \rangle$ with (upwards) operator precedence $\langle precedence \rangle$. Inserts parentheses according to the current downwards precedence and operator precedence.

Annotates $\langle body \rangle$ as the $\langle int \rangle$ th argument of the current OMA or OMBIND, with (downwards) argument precedence $\langle prec \rangle$.

STEXInternalTermMathAssocArgiiii $\texttt{stex_term_arg:nnn} (int) (prec) (notation) (body)$

Annotates $\langle body \rangle$ as the $\langle int \rangle$ th (associative) sequence argument (as comma-separated list of terms) of the current OMA or OMBIND, with (downwards) argument precedence $\langle prec \rangle$ and associative notation $\langle notation \rangle$.

\infprec \neginfprec

Maximal and minimal notation precedences.

\dobrackets

\dobrackets $\{\langle body \rangle\}$

Puts $\langle body \rangle$ in parentheses; scaled if in display mode unscaled otherwise. Uses the current STEX brackets (by default (and)), which can be changed temporarily using \withbrackets.

\withbrackets

\withbrackets $\langle left \rangle \langle right \rangle \{\langle body \rangle\}$

Temporarily (i.e. within $\langle body \rangle$) sets the brackets used by STEX for automated bracketing (by default (and)) to $\langle left \rangle$ and $\langle right \rangle$.

Note that $\langle \mathit{left} \rangle$ and $\langle \mathit{right} \rangle$ need to be allowed after \left and \right in displaymode.

\stex_term_custom:nn

 $\stex_term_custom:nn{\langle \mathit{URI} \rangle}{\langle \mathit{args} \rangle}$

Implements custom one-time notation. Invoked by \stex_invoke_symbol:n in text mode, or if followed by * in math mode, or whenever followed by !.

\comp
\compemph
\compemph@uri
\defemph@uri
\symrefemph
\symrefemph@uri
\varemph
\varemph@uri

 $\{\langle args \rangle\}$

Marks $\langle args \rangle$ as a notation component of the current symbol for highlighting, linking, etc.

The precise behavior is governed by \@comp, which takes as additional argument the URI of the current symbol. By default, \@comp adds the URI as a PDF tooltip and colors the highlighted part in blue.

\@defemph behaves like \@comp, and can be similarly redefined, but marks an expression as definiendum (used by \definiendum)

\STEXinvisible

Exports its argument as OMDoc (invisible), but does not produce PDF output. Useful e.g. for semantic macros that take arguments that are not part of the symbolic notation.

\ellipses

STEX

-Basics Implementation

24.1 The STEXDocument Class

The stex document class is pretty straight-forward: It largely extends the standalone package and loads the stex package, passing all provided options on to the package.

```
3 %%%%%%%%%%%%%%%
                                                               basics.dtx
                                                                                                             5 \RequirePackage{expl3,13keys2e}

                            We define four macros for introducing attributes in the HTML output. The definitions
      \stex_annotate:enw
```

\stex_annotate_invisible:n \stex_annotate_invisible:nnn depend on the "backend" used (LATEXML, RusTeX, pdflatex).

The pdflatex-macros largely do nothing; the RusTrX-implementations are pretty clear in what they do, the LATEXML-implementations resort to perl bindings.

```

25.3 File Hooks and Tracking

```
510 (@@=stex_files)
```

521

We introduce hooks for file inputs that keep track of the absolute paths of files used. This will be useful to keep track of modules, their archives, namespaces etc.

Note that the absolute paths are only accurate in \input-statements for paths relative to the PWD, so they shouldn't be relied upon in any other setting than for STEX-purposes.

```
keeps track of file changes

\c__stex_sproof_flow_str We define this macro, so that we can test whether the display key has the value flow

| Systa | Str_set:Nn\c_stex_sproof_flow_str{inline} |

```
(End\ definition\ for\ \c_stex\_sproof\_flow\_str.)
```

For proofs, we will have to have deeply nested structures of enumerated list-like environments. However, LATEX only allows enumerate environments up to nesting depth 4 and general list environments up to listing depth 6. This is not enough for us. Therefore we have decided to go along the route proposed by Leslie Lamport to use a single top-level list with dotted sequences of numbers to identify the position in the proof tree. Unfortunately, we could not use his pf.sty package directly, since it does not do automatic numbering, and we have to add keyword arguments all over the place, to accommodate semantic information.

(End definition for spfeq. This function is documented on page ??.)

In this environment, we initialize the proof depth counter \count10 to 10, and set up the description environment that will take the proof steps. At the end of the proof, we position the proof end into the last line.

(End definition for \spfidea. This function is documented on page 44.)

The next two environments (proof steps) and comments, are mostly semantical, they take KeyVal arguments that specify their semantic role. In draft mode, they read these values and show them. If the surrounding proof had display=flow, then no new \item is generated, otherwise it is. In any case, the proof step number (at the current level) is incremented.

     args
6457
6458 }
```

The next three environments and macros are purely semantic, so we ignore the keyval arguments for now and only display the content.¹⁶

```
\spfjust
```

EdN:16

```
6459 \newcommand\spfjust[1][]{}
```

(End definition for \spfjust. This function is documented on page 45.)

\premise

```
6460 \newcommand\stex_proof_premise:[2][]{#2}
```

(End definition for \premise. This function is documented on page 45.)

\justarg

the \justarg macro is purely semantic, so we ignore the keyval arguments for now and only display the content.

```
6461 \newcommand\justarg[2][]{#2}
6462 \langle /package \rangle
```

(End definition for \justarg. This function is documented on page 45.)

Some auxiliary code, and clean up to be executed at the end of the package.

 $^{^{16}\}mathrm{EdNote}$: need to do something about the premise in draft mode.

Chapter 37

document-structure.sty Implementation

```
6752 \*package\\
6753 \( \text{QC=document_structure} \\
6754 \ProvidesExplPackage{document-structure} \{ 2022/02/26 \} \{ 3.0.1 \} \{ Modular Document Structure} \\
6755 \RequirePackage \{ 13keys 2e \}
```

37.1 Package Options

We declare some switches which will modify the behavior according to the package options. Generally, an option xxx will just set the appropriate switches to true (otherwise they stay false).

```
6756
6757 \keys_define:nn{ document-structure }{
     class .str_set_x:N = \c_document_structure_class_str,
     topsect
                .str_set_x:N = \c_document_structure_topsect_str,,
     unknown
                .code:n
                          = {
       \PassOptionsToClass{\CurrentOption}{stex}
       \PassOptionsToClass{\CurrentOption}{tikzinput}
6763
      showignores .bool_set:N = \c_document_structure_showignores_bool,
6764 %
6766 \ProcessKeysOptions{ document-structure }
   \str_if_empty:NT \c_document_structure_class_str {
     \str_set:Nn \c_document_structure_class_str {article}
6770 \str_if_empty:NT \c_document_structure_topsect_str {
     \str_set:Nn \c_document_structure_topsect_str {section}
6771
6772 }
```

Then we need to set up the packages by requiring the **sref** package to be loaded, and set up triggers for other languages

```
6773 \RequirePackage{xspace}
6774 \RequirePackage{comment}
6775 \RequirePackage{stex}
6776 \AddToHook{begindocument}{
```

\section@level

Finally, we set the \section@level macro that governs sectioning. The default is two (corresponding to the article class), then we set the defaults for the standard classes book and report and then we take care of the levels passed in via the topsect option.

```
\int_new:N \l_document_structure_section_level_int
   \str_case:VnF \c_document_structure_topsect_str {
6785
     {part}{
6786
        \int_set:Nn \l_document_structure_section_level_int {0}
6787
6788
     {chapter}{
6789
        \int_set:Nn \l_document_structure_section_level_int {1}
6791
6792 }{
      \str_case:VnF \c_document_structure_class_str {
6793
6794
        {book}{
          \int_set:Nn \l_document_structure_section_level_int {0}
6795
6796
        {report}{
6797
          \int_set:Nn \l_document_structure_section_level_int {0}
6798
6799
6800
        \int_set:Nn \l_document_structure_section_level_int {2}
     }
6803 }
```

37.2 Document Structure

The structure of the document is given by the sfragment environment. The hierarchy is adjusted automatically according to the LATEX class in effect.

\currentsectionlevel

EdN:17

For the \currentsectionlevel and \Currentsectionlevel macros we use an internal macro \current@section@level that only contains the keyword (no markup). We initialize it with "document" as a default. In the generated OMDoc, we only generate a text element of class omdoc_currentsectionlevel, wich will be instantiated by CSS later. ¹⁷

```
def\current@section@level{document}%
newcommand\currentsectionlevel{\lowercase\expandafter{\current@section@level}\xspace}%
newcommand\Currentsectionlevel{\expandafter\MakeUppercase\current@section@level\xspace}%
```

 $(\textit{End definition for \backslash current section level. This function is documented on page $52.})$

\skipfragment

```
6807 \cs_new_protected:Npn \skipfragment {
```

 $^{17 {}m EDNoTE}$: MK: we may have to experiment with the more powerful uppercasing macro from mfirstuc.sty once we internationalize.

```

6864
     \keys_set:nn { document-structure / sfragment } { #1 }
6865
6866 }
```

\at@begin@sfragment

we define a switch for numbering lines and a hook for the beginning of groups: The \at@begin@sfragment macro allows customization. It is run at the beginning of the sfragment, i.e. after the section heading.

```
6867 \newif\if@mainmatter\@mainmattertrue
6868 \newcommand\at@begin@sfragment[3][]{}
```

Then we define a helper macro that takes care of the sectioning magic. It comes with its own key/value interface for customization.

```
\keys_define:nn { document-structure / sectioning }{
              .str_set_x:N = \l__document_structure_sect_name_str
6870
              .str_set_x:N = \l__document_structure_sect_ref_str
6871
                             = \l__document_structure_sect_clear_bool ,
     clear
              .bool_set:N
6872
              .default:n
                             = {true}
     clear
6873
              .bool_set:N
                             = \l__document_structure_sect_num_bool
6874
     num
     nıım
              .default:n
                            = {true}
6875
6876
   \cs_new_protected:Nn \__document_structure_sect_args:n {
6877
     \str_clear:N \l__document_structure_sect_name_str
6878
     \str_clear:N \l__document_structure_sect_ref_str
6879
     \bool_set_false:N \l__document_structure_sect_clear_bool
6880
     \bool_set_false:N \l__document_structure_sect_num_bool
6881
      \keys_set:nn { document-structure / sectioning } { #1 }
6882
6883
   \newcommand\omdoc@sectioning[3][]{
6884
     \__document_structure_sect_args:n {#1 }
     \let\omdoc@sect@name\l__document_structure_sect_name_str
     \bool_if:NT \l__document_structure_sect_clear_bool { \cleardoublepage }
     \if@mainmatter% numbering not overridden by frontmatter, etc.
6888
       \bool_if:NTF \l__document_structure_sect_num_bool {
6889
```

```
\sfragment@num{#2}{#3}
6890
        }{
6891
           \sfragment@nonum{#2}{#3}
6892
        }
6893
        \def\current@section@level{\omdoc@sect@name}
6894
6895
        \sfragment@nonum{#2}{#3}
6896
      \fi
6897
6898 }% if@mainmatter
```

and another one, if redefines the \addtocontentsline macro of LATEX to import the respective macros. It takes as an argument a list of module names.

```
% \newcommand\sfragment@redefine@addtocontents[1]{%
%\edef\__document_structureimport{#1}%
6901 %\@for\@I:=\__document_structureimport\do{%
6902 %\edef\@path{\csname module@\@I @path\endcsname}%
6903 %\@ifundefined{tf@toc}\relax%
6904 % {\protected@write\tf@toc{}{\string\@requiremodules{\@path}}}
6905 %\ifx\hyper@anchor\@undefined% hyperref.sty loaded?
6906 %\def\addcontentsline##1##2##3{%
6907 %\addtocontents{##1}{\protect\contentsline{##2}{\string\withusedmodules{#1}{##3}}{\thepage}}
6908 %\else% hyperref.sty not loaded
6909 %\def\addcontentsline##1##2##3{%
6910 %\addtocontents{##1}{\protect\contentsline{##2}{\string\withusedmodules{#1}{##3}}{\thepage}}
6911 %\fi
6912 }% hyperref.sty loaded?
```

now the sfragment environment itself. This takes care of the table of contents via the helper macro above and then selects the appropriate sectioning command from article.cls. It also registeres the current level of sfragments in the \sfragment@level counter.

```
6913 \newenvironment{sfragment}[2][]% keys, title
6914 {
6915 \__document_structure_sfragment_args:n { #1 }%\sref@target%
```

If the loadmodules key is set on \begin{sfragment}, we redefine the \addcontetsline macro that determines how the sectioning commands below construct the entries for the table of contents.

```
\stex_csl_to_imports:No \usemodule \l__document_structure_sfragment_imports_tl

6917

6918 \bool_if:NT \l__document_structure_sfragment_loadmodules_bool {
6919 \sfragment@redefine@addtocontents{
6920 \%\@ifundefined{module@id}\used@modules%
6921 \%\@ifundefined{module@idoule@id @path}{\used@modules}\module@id}
6922 }

6923 }
```

now we only need to construct the right sectioning depending on the value of \section@level.

```
6924
6925 \stex_document_title:n { #2 }
6926
6927 \int_incr:N\l_document_structure_section_level_int
6928 \ifcase\l_document_structure_section_level_int
6929 \or\omdoc@sectioning[name=\omdoc@part@kw,clear,num]{part}{#2}
6930 \or\omdoc@sectioning[name=\omdoc@chapter@kw,clear,num]{chapter}{#2}
```

```
\or\omdoc@sectioning[name=\omdoc@section@kw,num]{section}{#2}
6931
       \or\omdoc@sectioning[name=\omdoc@subsection@kw,num]{subsection}{#2}
6932
       \or\omdoc@sectioning[name=\omdoc@subsubsection@kw,num]{subsubsection}{#2}
6933
       \or\omdoc@sectioning[name=\omdoc@paragraph@kw,ref=this \omdoc@paragraph@kw]{paragraph}{#
6934
       \or\omdoc@sectioning[name=\omdoc@subparagraph@kw,ref=this \omdoc@subparagraph@kw]{paragraph@kw}
6935
6936
     \at@begin@sfragment[#1]\l_document_structure_section_level_int{#2}
6937
     \str_if_empty:NF \l__document_structure_sfragment_id_str {
6938
       \stex_ref_new_doc_target:n\l__document_structure_sfragment_id_str
6941 }% for customization
6942 {}
    and finally, we localize the sections
   \newcommand\omdoc@part@kw{Part}
   \newcommand\omdoc@chapter@kw{Chapter}
   \newcommand\omdoc@section@kw{Section}
   \newcommand\omdoc@subsection@kw{Subsection}
   \newcommand\omdoc@subsubsection@kw{Subsubsection}
   \newcommand\omdoc@paragraph@kw{paragraph}
   \newcommand\omdoc@subparagraph@kw{subparagraph}
```

37.3 Front and Backmatter

Index markup is provided by the omtext package [Kohlhase:smmtf:git], so in the document-structure package we only need to supply the corresponding \printindex command, if it is not already defined

\printindex

```
\verb|\providecommand\printindex{\IfFileExists{\jobname.ind}{\input{\jobname.ind}}}|}|
```

(End definition for \printindex. This function is documented on page ??.)

some classes (e.g. book.cls) already have \frontmatter, \mainmatter, and \backmatter macros. As we want to define frontmatter and backmatter environments, we save their behavior (possibly defining it) in orig@*matter macros and make them undefined (so that we can define the environments).

```
\cs_if_exist:NTF\frontmatter{
     \let\__document_structure_orig_frontmatter\frontmatter
6952
6953
     \let\frontmatter\relax
6954 }{
     \tl_set:Nn\__document_structure_orig_frontmatter{
6955
        \clearpage
6956
        \@mainmatterfalse
6957
        \pagenumbering{roman}
6958
6959
6960 }
   \cs_if_exist:NTF\backmatter{
     \let\__document_structure_orig_backmatter\backmatter
     \let\backmatter\relax
6963
6964 }{
     \tl_set:Nn\__document_structure_orig_backmatter{
6965
        \clearpage
6966
        \@mainmatterfalse
6967
```

```
\pagenumbering{roman}
                 6969
                 6970 }
                     Using these, we can now define the frontmatter and backmatter environments
                 we use the \orig@frontmatter macro defined above and \mainmatter if it exists, oth-
   frontmatter
                 erwise we define it.
                     \newenvironment{frontmatter}{
                        \__document_structure_orig_frontmatter
                 6972
                 6973 }{
                       \cs_if_exist:NTF\mainmatter{
                 6974
                         \mainmatter
                 6975
                       7.

Chapter 38

NotesSlides – Implementation

38.1 Class and Package Options

We define some Package Options and switches for the notesslides class and activate them by passing them on to beamer.cls and omdoc.cls and the notesslides package. We pass the nontheorem option to the statements package when we are not in notes mode, since the beamer package has its own (overlay-aware) theorem environments.

```
7022 (*cls)
7023 (@@=notesslides)
7024 \ProvidesExplClass{notesslides}{2022/02/28}{3.1.0}{notesslides Class}
7025 \RequirePackage{13keys2e}
7026
7027 \keys_define:nn{notesslides / cls}{
             .str_set_x:N = \c_notesslides_class_str_s
7028
             .bool_set:N = \c_notesslides_notes_bool_set:N = \c_notesslides_notes_bool_set.
7029
                       = { \bool_set_false: N \c__notesslides_notes_bool },
     slides
             .code:n
7030
     docopt .str_set_x:N = \c_notesslides_docopt_str,
                        = {
     unknown .code:n

      unknown
                      .code:n
        \PassOptionsToClass{\CurrentOption}{stex}
        \PassOptionsToClass{\CurrentOption}{tikzinput}
7081
    \ProcessKeysOptions{ notesslides / pkg }
7083
7084
    \RequirePackage{stex}
7085
    \stex html backend:T {
      \bool_set_true:N\c__notesslides_notes_bool
7087
7088
7089
    \newif\ifnotes
    \bool_if:NTF \c__notesslides_notes_bool {
      \notestrue
7093
7094
      \notesfalse
7095 }
we give ourselves a macro \@ctopsect that needs only be evaluated once, so that the
\ifdefstring conditionals work below.
7097 \str_if_empty:NTF \c__notesslides_topsect_str {
      \str_set_eq:NN \__notesslidestopsect \c__notesslides_defaulttopsec_str
7098
7099 }{
      \str_set_eq:NN \__notesslidestopsect \c__notesslides_topsect_str
7100
7101 }
7102 \PassOptionsToPackage{topsect=\_notesslidestopsect}{document-structure}
```

```
7103 (/package)
```

Depending on the options, we either load the article-based document-structure or the beamer class (and set some counters).

```
7104
    \bool_if:NTF \c__notesslides_notes_bool {
      \str_if_empty:NT \c__notesslides_class_str {
7106
        \str_set:Nn \c__notesslides_class_str {article}
7108
      \verb|\exp_after:wN| LoadClass| exp_after:wN[\c__notesslides_docopt_str]|
7109
        {\c_notesslides\_class\_str}
7110
7111 }{
      \LoadClass[10pt,notheorems,xcolor={dvipsnames,svgnames}]{beamer}
7112
      \newcounter{Item}
      \newcounter{paragraph}
7114
      \newcounter{subparagraph}
7115
      \newcounter{Hfootnote}
7116
7118 \RequirePackage{document-structure}
now it only remains to load the notesslides package that does all the rest.
7119 \RequirePackage{notesslides}
```

```
7120 (/cls)
```

In notes mode, we also have to make the beamer-specific things available to article via the beamerarticle package. We use options to avoid loading theorem-like environments, since we want to use our own from the STEX packages. The first batch of packages we want are loaded on notesslides.sty. These are the general ones, we will load the STFX-specific ones after we have done some work (e.g. defined the counters m*). Only the stex-logo package is already needed now for the default theme.

```
(*package)
7121
   \bool if:NT \c notesslides notes bool {
    \RequirePackage{a4wide}
7123
    \RequirePackage{marginnote}
7124
    \PassOptionsToPackage{usenames, dvipsnames, svgnames}{xcolor}
7125
    \RequirePackage{mdframed}
    \RequirePackage[noxcolor,noamsthm]{beamerarticle}
    7128
7129
  \RequirePackage{stex-tikzinput}
7130
  \RequirePackage{etoolbox}
  \RequirePackage{amssymb}
7132
  \RequirePackage{amsmath}
  \RequirePackage{comment}
  \RequirePackage{textcomp}
  \RequirePackage{url}
```

38.2 Notes and Slides

7137 \RequirePackage{graphicx} 7138 \RequirePackage{pgf}

For the lecture notes cases, we also provide the \usetheme macro that would otherwise come from the the beamer class. While the latter loads beamertheme (theme).sty, the

```
notes version loads beamernotestheme (theme).sty. 18

7139 \bool_if:NT \c__notesslides_notes_bool {
7140 \renewcommand\usetheme[2][]{\usepackage[#1]{beamernotestheme#2}}}
7141 }

7142

7143

7144 \NewDocumentCommand \libusetheme {0{} m} {
7145 \bool_if:NTF \c__notesslides_notes_bool {
7146 \libusepackage[#1]{beamernotestheme#2}}

7147 }{
7148 \libusepackage[#1]{beamertheme#2}

7149 }

7150 }
```

We define the sizes of slides in the notes. Somehow, we cannot get by with the same here.

```
7152 \newcounter{slide}
7153 \newlength{\slidewidth}\setlength{\slidewidth}{13.5cm}
7154 \newlength{\slideheight}\setlength{\slideheight}{9cm}
```

note The note environment is used to leave out text in the slides mode. It does not have a counterpart in OMDoc. So for course notes, we define the note environment to be a no-operation otherwise we declare the note environment as a comment via the comment package.

```
7155 \bool_if:NTF \c__notesslides_notes_bool {
7156 \renewenvironment{note}{\ignorespaces}{}
7157 }{
7158 \excludecomment{note}
7159 }
```

We first set up the slide boxes in article mode. We set up sizes and provide a box register for the frames and a counter for the slides.

```
7160 \bool_if:NT \c__notesslides_notes_bool {
7161 \newlength{\slideframewidth}}
7162 \setlength{\slideframewidth}{1.5pt}
```

frame We first define the keys.

```
\cs_new_protected:Nn \__notesslides_do_yes_param:Nn {
        \exp_args:Nx \str_if_eq:nnTF { \str_uppercase:n{ #2 } }{ yes }{
          \bool_set_true:N #1

```

38.3 Header and Footer Lines

Now, we set up the infrastructure for the footer line of the slides, we use boxes for the logos, so that they are only loaded once, that considerably speeds up processing.

\setslidelogo The default logo is the STEX logo. Customization can be done by \setslidelogo{ $\langle logo name \rangle$ }.

```
7290
   \newlength{\slidelogoheight}
    \RequirePackage{graphicx}
7292
7293
   \define@key{Gin}{mhrepos}{\def\Gin@mhrepos{#1}}
7294
   \providecommand\mhgraphics[2][]{
7295
      \def\Gin@mhrepos{}\setkeys{Gin}{#1}
7296
      \includegraphics[#1]{\mhpath\Gin@mhrepos{#2}}
7297
7298 }
    \bool_if:NTF \c__notesslides_notes_bool {
7302
     \setlength{\slidelogoheight}{.4cm}
7303
   7-{
7304
      \setlength{\slidelogoheight}{1cm}
7305
7306
    \ifcsname slidelogo\endcsname\else
7307
      \newsavebox{\slidelogo}
7308
      \sline {slidelogo}{steX}
7309
    \newrobustcmd{\setslidelogo}[2][]{
7312
      \tl_if_empty:nTF{#1}{
        \sbox{\slidelogo}{\includegraphics[height=\slidelogoheight]{#2}}
7313
     7.5
7314
        \sbox{\slidelogo}{\mhgraphics[height=\slidelogoheight,mhrepos=#1]{#2}}
7315
7316
7317 }
```

(End definition for \setslidelogo. This function is documented on page 54.)

\setsource

\source stores the writer's name. By default it is *Michael Kohlhase* since he is the main user and designer of this package. \setsource $\{\langle name \rangle\}$ can change the writer's name.

```
7318 \def\source{Michael Kohlhase}% customize locally
7319 \newrobustcmd{\setsource}[1]{\def\source{#1}}
```

(End definition for \setsource. This function is documented on page 54.)

\setlicensing

Now, we set up the copyright and licensing. By default we use the Creative Commons Attribuition-ShareAlike license to strengthen the public domain. If package hyperref is loaded, then we can attach a hyperlink to the license logo. $\ensuremath{\mbox{setlicensing}}[\langle url \rangle] \{\langle logo\ name \rangle\}$ is used for customization, where $\langle url \rangle$ is optional.

```
7320 \def\copyrightnotice{\footnotesize\copyright :\hspace{.3ex}{\source}}
7321 \newsavebox{\cclogo}
7322 \sbox{\cclogo}{\includegraphics[height=\slidelogoheight]{stex-cc_somerights}}

7396
7397
7398 } % ifmks@sty@frameimages
```

(End definition for \frameimage. This function is documented on page 55.)

38.5 Colors and Highlighting

We first specify sans serif fonts as the default.

```
7399 \sffamily
```

Now, we set up an infrastructure for highlighting phrases in slides. Note that we use content-oriented macros for highlighting rather than directly using color markup. The first thing to to is to adapt the green so that it is dark enough for most beamers

```
7400 \AddToHook{begindocument}{
7401 \definecolor{green}{rgb}{0,.5,0}
7402 \definecolor{purple}{cmyk}{.3,1,0,.17}
7403 }
```

We customize the \defemph, \symrefemph, \compemph, and \titleemph macros with colors. Furthermore we customize the __omtextlec macro for the appearance of line end comments in \lec.

```
7404 % \def\STpresent#1{\textcolor{blue}{#1}}
7405 \def\defemph#1{{\textcolor{magenta}{#1}}}
7406 \def\symrefemph#1{{\textcolor{cyan}{#1}}}
7407 \def\compemph#1f{\textcolor{blue}{#1}}}
7408 \def\__omtext_lec#1{(\textcolor{green}{#1})}
```

I like to use the dangerous bend symbol for warnings, so we provide it here.

\textwarning as the macro can be used quite often we put it into a box register, so that it is only loaded once.

```
\verb|\pgfdeclareimage[width=.8em]{miko@small@dbend}{stex-dangerous-bend}|
    \def\smalltextwarning{
      \pgfuseimage{miko@small@dbend}
7412
      \xspace
7413
7414 }
    \pgfdeclareimage[width=1.2em]{miko@dbend}{stex-dangerous-bend}
7415
    \newrobustcmd\textwarning{
      \raisebox{-.05cm}{\pgfuseimage{miko@dbend}}
7419 }
   \newrobustcmd\bigtextwarning{
      \raisebox{-.05cm}{\pgfuseimage{miko@big@dbend}}
7422
      \xspace
7423
7424 }
(End definition for \textwarning. This function is documented on page 55.)
7425 \newrobustcmd\putgraphicsat[3]{
     \begin{picture}(0,0) \not (#1) {\include graphics [#2] {#3}} \end{picture}
7427 }
   \newrobustcmd\putat[2]{
7428
7429
      \begin{picture}(0,0)\put(#1){#2}\end{picture}
7430 }
```

38.6 Sectioning

If the sectocframes option is set, then we make section frames. We first define counters for part and chapter, which beamer.cls does not have and we make the section counter which it does dependent on chapter.

```
7431 \stex_html_backend:F {
7432 \bool_if:NT \c__notesslides_sectocframes_bool {
7433 \str_if_eq:VnTF \__notesslidestopsect{part}{
7434 \newcounter{chapter}\counterwithin*{section}{chapter}
7435 }{
7436 \str_if_eq:VnT\__notesslidestopsect{chapter}{
7437 \newcounter{chapter}\counterwithin*{section}{chapter}
7438 }
7439 }
7440 }
7441 }
```

\section@level

We set the \section@level counter that governs sectioning according to the class options. We also introduce the sectioning counters accordingly.

\section@level

```
7442 \def\part@prefix{}
7443 \@ifpackageloaded{document-structure}{}{
7444 \str_case:VnF \__notesslidestopsect {
7445 \{part}}{
```

```
\int_set:Nn \l_document_structure_section_level_int {0}
          \def\thesection{\arabic{chapter}.\arabic{section}}
7447
          \def\part@prefix{\arabic{chapter}.}
7448
7449
        {chapter}{
7450
          \int_set:Nn \l_document_structure_section_level_int {1}
7451
          \def\thesection{\arabic{chapter}.\arabic{section}}
7452
          \def\part@prefix{\arabic{chapter}.}
7453
     7-{
7455
        \int_set:Nn \l_document_structure_section_level_int {2}
7456
        \def\part@prefix{}
7457
7458
7459
7460
   \bool_if:NF \c__notesslides_notes_bool { % only in slides
```

(End definition for \section@level. This function is documented on page ??.)

The new counters are used in the sfragment environment that choses the LATEX

sectioning macros according to \section@level.

sfragment

```

```

38.7 Excursions

\excursion

The excursion macros are very simple, we define a new internal macro \excursionref and use it in \excursion, which is just an \inputref that checks if the new macro is defined before formatting the file in the argument.

```
\gdef\printexcursions{}
    \newcommand\excursionref[2]{% label, text
      \bool if:NT \c notesslides notes bool {
7545
        \begin{sparagraph}[title=Excursion]
7546
          #2 \sref[fallback=the appendix]{#1}.
7547
        \end{sparagraph}
7550 }
    \newcommand\activate@excursion[2][]{
7551
      \gappto\printexcursions{\inputref[#1]{#2}}
7553 }
    \newcommand\excursion[4][]{% repos, label, path, text
7554
      \bool if:NT \c notesslides notes bool {
7555
        \activate@excursion[#1]{#3}\excursionref{#2}{#4}
7556
7557
7558 }
(End definition for \excursion. This function is documented on page 55.)
```

\excursiongroup

```
7559 \keys_define:nn{notesslides / excursiongroup }{
     id
                .str_set_x:N = \l__notesslides_excursion_id_str,
                              = \l__notesslides_excursion_intro_tl,
     intro
                .tl_set:N
               .str_set_x:N = \l__notesslides_excursion_mhrepos_str
7562
     mhrepos
7563 }
   \cs_new_protected:Nn \__notesslides_excursion_args:n {
7564
     \tl_clear:N \l__notesslides_excursion_intro_tl
7565
     \str_clear:N \l__notesslides_excursion_id_str
7566
     \str_clear:N \l__notesslides_excursion_mhrepos_str
7567
     \keys_set:nn {notesslides / excursiongroup }{ #1 }
7568
7569 }
   \newcommand\excursiongroup[1][]{
     \__notesslides_excursion_args:n{ #1 }
     \footnote{Model} \ only if there are excursions
7572
     {\begin{note}
7573
       \begin{sfragment}[#1]{Excursions}%
7574
          \ifdefempty\l__notesslides_excursion_intro_tl{}{
7575
            \inputref[\l__notesslides_excursion_mhrepos_str]{
7576
              \l__notesslides_excursion_intro_tl
7577
7578
         }
7579
          \printexcursions%
       \end{sfragment}
     \end{note}}
```

(End definition for $\ensuremath{\backslash} excursion$ group. This function is documented on page 56.)

Chapter 39

The Implementation

39.1 Package Options

The first step is to declare (a few) package options that handle whether certain information is printed or not. They all come with their own conditionals that are set by the options.

```
7586 (*package)
7587 (@@=problems)
7588 \ProvidesExplPackage{problem}{2022/02/26}{3.0.1}{Semantic Markup for Problems}
   \RequirePackage{13keys2e,stex}
7590
7591 \keys_define:nn { problem / pkg }{
    notes   .default:n = { true },
7592
               .bool_set:N = \c__problems_notes_bool,
    notes
                            = { true },
     gnotes
               .default:n
     gnotes .bool_set:N = \c__problems_gnotes_bool,
7595
    hints
              .default:n
                             = { true },
7596
            .bool_set:N = \c__problems_hints_bool,
    hints
7597
    solutions .default:n
                             = { true },
7598
    solutions .bool_set:N = \c_problems_solutions_bool,
7599
            .default:n
                             = { true },
    pts
7600
             .bool_set:N = \c_problems_pts_bool,
    pts
7601
             .default:n
                             = { true },
7602
             .bool\_set:N = \c_\_problems\_min\_bool,
     boxed .default:n
                             = { true },
              .bool_set:N = \c_problems_boxed_bool,
     boxed
     unknown .code:n
7606
7607 }
7608 \newif\ifsolutions
7609
7610 \ProcessKeysOptions{ problem / pkg }
7611 \bool_if:NTF \c__problems_solutions_bool {
     \solutionstrue
7612
7613 }{
     \solutionsfalse
7615 }
```

Then we make sure that the necessary packages are loaded (in the right versions).

```
7616 \RequirePackage{comment}
```

The next package relies on the LATEX3 kernel, which LATEXMLonly partially supports. As it is purely presentational, we only load it when the boxed option is given and we run LATEXML.

```
7617 \bool_if:NT \c__problems_boxed_bool { \RequirePackage{mdframed} }
```

\prob@*@kw For multilinguality, we define internal macros for keywords that can be specialized in *.ldf files.

```
7618 \def\prob@problem@kw{Problem}
7619 \def\prob@solution@kw{Solution}
7620 \def\prob@hint@kw{Hint}
7621 \def\prob@note@kw{Note}
7622 \def\prob@gnote@kw{Grading}
7623 \def\prob@pt@kw{pt}
7624 \def\prob@min@kw{min}
(End definition for \prob@*@kw. This function is documented on page ??.)
    For the other languages, we set up triggers
    \AddToHook{begindocument}{
      \ltx@ifpackageloaded{babel}{
           \makeatletter
           \clist_set:Nx \l_tmpa_clist {\bbl@loaded}
           \clist_if_in:NnT \l_tmpa_clist {ngerman}{
7629
             \input{problem-ngerman.ldf}
7630
7631
           \clist_if_in:NnT \l_tmpa_clist {finnish}{
7632
             \input{problem-finnish.ldf}
7633
7634
           \clist_if_in:NnT \l_tmpa_clist {french}{
7635
             \input{problem-french.ldf}
7636
           \clist_if_in:NnT \l_tmpa_clist {russian}{
             \input{problem-russian.ldf}
7639
7640
           \makeatother
7641
      }{}
7642
7643 }
```

39.2 Problems and Solutions

We now prepare the KeyVal support for problems. The key macros just set appropriate internal macros.

```
\keys_define:nn{ problem / problem }{
             .str_set_x:N = \l_problems_prob_id_str,
     id
                            = \1_problems_prob_pts_t1,
     pts
7646
             .tl_set:N
             .tl_set:N
                            = \l__problems_prob_min_tl,
7647
     min
                            = \l__problems_prob_title_tl,
             .tl_set:N
7648
     title
             .tl_set:N
                            = \l__problems_prob_type_tl,
7649
     type
     imports .tl_set:N
                            = \l__problems_prob_imports_tl,
7650
              .str_set_x:N = \l__problems_prob_name_str,
7651
                            = \l_problems_prob_refnum_int
     refnum
             .int_set:N
```

```
\cs_new_protected:Nn \__problems_prob_args:n {
                     7654
                           \str_clear:N \l__problems_prob_id_str
                     7655
                           \str_clear:N \l__problems_prob_name_str
                     7656
                           \tl_clear:N \l__problems_prob_pts_tl
                     7657
                           \tl_clear:N \l__problems_prob_min_tl
                     7658
                           \tl_clear:N \l__problems_prob_title_tl
                     7659
                           \tl_clear:N \l__problems_prob_type_tl
                     7660
                           \tl_clear:N \l__problems_prob_imports_tl
                           \keys_set:nn { problem / problem }{ #1 }
                           \int_compare:nNnT \l__problems_prob_refnum_int = 0 {
                     7664
                             \verb|\label{lems_prob_refnum_int}| \verb|\label{lems_prob_refnum_int}| \verb|\label{lems_prob_refnum_int}| |
                     7665
                     7666
                     7667
                         Then we set up a counter for problems.
\numberproblemsin
                         \newcounter{problem}[section]
                         \newcommand\numberproblemsin[1]{\@addtoreset{problem}{#1}}
                     (End definition for \numberproblemsin. This function is documented on page ??.)
                    We provide the macro \prob@label to redefine later to get context involved.
                     7670 \newcommand\prob@label[1]{\thesection.#1}
                     (End definition for \prob@label. This function is documented on page ??.)
     \prob@number
                    We consolidate the problem number into a reusable internal macro
                         \newcommand\prob@number{
                           \int_if_exist:NTF \l__problems_inclprob_refnum_int {
                     7672
                     7673
                              \prob@label{\int_use:N \l__problems_inclprob_refnum_int }
                     7674
                             \int_if_exist:NTF \l__problems_prob_refnum_int {
                     7675
                                \prob@label{\int_use:N \l__problems_prob_refnum_int }
                     7676
                             7.
                     7677
                                  \prob@label\theproblem
                     7678
                     7679
                           }
                     7680
                     7681 }
                     (End definition for \prob@number. This function is documented on page ??.)
```

7653 }

\prob@title We consolidate the problem title into a reusable internal macro as well. \prob@title takes three arguments the first is the fallback when no title is given at all, the second and third go around the title, if one is given.

```
7682 \newcommand\prob@title[3]{%
7683 \tl_if_exist:NTF \l_problems_inclprob_title_tl {
7684 #2 \l_problems_inclprob_title_tl #3
7685 }{
7686 \tl_if_exist:NTF \l_problems_prob_title_tl {
7687 #2 \l_problems_prob_title_tl #3
7688 }{
7688 }{
7689 #1
```

```
7690 }
7691 }
```

(End definition for \prob@title. This function is documented on page ??.)

With these the problem header is a one-liner

\prob@heading We consolidate the problem header line into a separate internal macro that can be reused in various settings.

```
7693 \def\prob@heading{
7694 {\prob@problem@kw}\ \prob@number\prob@title{~}{~(}{)\strut}
7695 %\sref@label@id{\prob@problem@kw~\prob@number}{}
7696 }
```

(End definition for \prob@heading. This function is documented on page ??.)

With this in place, we can now define the problem environment. It comes in two shapes, depending on whether we are in boxed mode or not. In both cases we increment the problem number and output the points and minutes (depending) on whether the respective options are set.

sproblem

```
\newenvironment{sproblem}[1][]{

                                                7834
                                               (End definition for \record@problem. This function is documented on page ??.)
```

\stex_if_do_html:T{

This macro acts on a problem's record in the *.aux file. It does not have any functionality here, but can be redefined elsewhere (e.g. in the assignment package).

```
7835 \def\@problem#1#2#3{}
```

(End definition for \Oproblem. This function is documented on page ??.)

solution

The solution environment is similar to the problem environment, only that it is independent of the boxed mode. It also has it's own keys that we need to define first.

```
\keys_define:nn { problem / solution }{
     id
                    .str_set_x:N = \l__problems_solution_id_str ,
7837
     for
                    .tl set:N
                                   = \l__problems_solution_for_tl ,
7838
     height
                    .dim set:N
                                   = \l__problems_solution_height_dim ,
7839
                    .clist_set:N = \l__problems_solution_creators_clist ,
7840
     creators
                   .clist_set:N = \l__problems_solution_contributors_clist ,
7841
     contributors
                    .tl set:N
                                   = \l_problems_solution_srccite_tl
7842
7843 }
   \cs_new_protected:Nn \__problems_solution_args:n {
7844
     \str_clear:N \l__problems_solution_id_str
7845
     \tl_clear:N \l__problems_solution_for_tl
7846
     \tl_clear:N \l__problems_solution_srccite_tl
7847
     \clist_clear:N \l__problems_solution_creators_clist
7848
     \verb|\clist_clear:N \lines| 1 is the contributors_clist|
7849
     \dim_zero:N \l__problems_solution_height_dim
7850
     \keys_set:nn { problem / solution }{ #1 }
7851
7852 }
```

the next step is to define a helper macro that does what is needed to start a solution.

```
\newcommand\@startsolution[1][]{
7854 \__problems_solution_args:n { #1 }
7855 \@in@omtexttrue% we are in a statement.
7856 \bool_if:NF \c__problems_boxed_bool { \hrule }
7857 \smallskip\noindent
7858 {\textbf\prob@solution@kw :\enspace}
7859 \begin{small}
7860 \def\current@section@level{\prob@solution@kw}
7861 \ignorespacesandpars
7862 }
```

\startsolutions

for the \startsolutions macro we use the \specialcomment macro from the comment package. Note that we use the \@startsolution macro in the start codes, that parses the optional argument.

```
\box_new:N \l__problems_solution_box
    \newenvironment{solution}[1][]{
7864
      \stex_html_backend:TF{
7865
        \stex_if_do_html:T{
7866
           \begin{stex_annotate_env}{solution}{}
7868
      7.5
7869
        \verb|\setbox|l_problems_solution_box| vbox| bgroup |
7870
           \par\smallskip\hrule\smallskip
7871
           \noindent\textbf{Solution:}~
7872
7873
7874 }{
      \stex_html_backend:TF{
```

```
\stex_if_do_html:T{
                                               7876
                                                                          \end{stex_annotate_env}
                                               7877
                                               7878

(End definition for \mcc. This function is documented on page 58.)

39.4 Including Problems

\includeproblem The \includeproblem command is essentially a glorified \input statement, it sets some internal macros first that overwrite the local points. Importantly, it resets the inclprob keys after the input.

```
\keys_define:nn{ problem / inclproblem }{
             .str_set_x:N = \l__problems_inclprob_id_str,
7995
     id
     pts
             .tl_set:N
                            = \l__problems_inclprob_pts_tl,
7996
             .tl_set:N
                            = \l__problems_inclprob_min_tl,
     min
7997
             .tl set:N
                            = \l_problems_inclprob_title_tl,
     title
7998
     refnum
             .int_set:N
                            = \l__problems_inclprob_refnum_int,
7999
     type
              .tl_set:N

39.5 Reporting Metadata

For messages it is OK to have them in English as the whole documentation is, and we can therefore assume authors can deal with it.

```
\AddToHook{enddocument}{
      \bool_if:NT \c_problems_pts_bool {
        \message{Total:~\arabic{pts}~points}
      \bool_if:NT \c__problems_min_bool {
8068
        \message{Total:~\arabic{min}~minutes}
8069
8070
8071 }
    The margin pars are reader-visible, so we need to translate
    \def \pts#1{
      \bool_if:NT \c__problems_pts_bool {
        \marginpar{#1~\prob@pt@kw}
8075
8076 }
    \def\min#1{
8077
      \bool_if:NT \c__problems_min_bool {
8078
        \marginpar{#1~\prob@min@kw}
8079
8080
8081 }
```

\show@pts The \show@pts shows the points: if no points are given from the outside and also no points are given locally do nothing, else show and add. If there are outside points then we show them in the margin.

```
\newcounter{pts}
    \def\show@pts{
      \tl_if_exist:NTF \l__problems_inclprob_pts_tl {

Chapter 40

Implementation: The hwexam Package

40.1 Package Options

The first step is to declare (a few) package options that handle whether certain information is printed or not. Some come with their own conditionals that are set by the options, the rest is just passed on to the problems package.

```
8121 (*package)
8122 \ProvidesExplPackage{hwexam}{2022/02/26}{3.0.1}{homework assignments and exams}
8123 \RequirePackage{13keys2e}
8124
8125 \newif\iftest\testfalse
8126 \DeclareOption{test}{\testrue}
8127 \newif\ifmultiple\multiplefalse
8128 \DeclareOption{multiple}{\multipletrue}
8129 \DeclareOption*{\PassOptionsToPackage{\CurrentOption}{problem}}
8120 \ProcessOptions
Then we make sure that the necessary packages are loaded (in the right versions).
8131 \RequirePackage{keyval}[1997/11/10]
8132 \RequirePackage{problem}
For multilinguality, we define internal macros for keywords that can be specialized in a specialized in the right versions.
```

\hwexam@*@kw

For multilinguality, we define internal macros for keywords that can be specialized in *.ldf files.

```

8161 \makeatother
8162 }{}
8163 }
8164
```

40.2 Assignments

8165 \newcounter{assignment}

Then we set up a counter for problems and make the problem counter inherited from problem.sty depend on it. Furthermore, we specialize the \prob@label macro to take the assignment counter into account.

```
8166 %\numberproblemsin{assignment}
    We will prepare the keyval support for the assignment environment.
8167 \keys define:nn { hwexam / assignment } {
8168 id .str set x:N = 100 assign id str,
8169 number .int_set:N = \l_@@_assign_number_int,

8231 }{ #2 }
8232 }
```

\assignment@title This macro prints the title of an assignment, the local title is overwritten, if there is one from the \inputassignment. \assignment@title takes three arguments the first is the

fallback when no title is given at all, the second and third go around the title, if one is given.

```
8233 \newcommand\assignment@title[3]{
8234 \tl_if_empty:NTF \l_@@_inclassign_title_tl {
8235 \tl_if_empty:NTF \l_@@_assign_title_tl {
8236 #1
8237 }{
8238 #2\l_@@_assign_title_tl#3
8239 }
8240 }{
8241 #2\l_@@_inclassign_title_tl#3
8242 }
8243 }
```

(End definition for \assignment@title. This function is documented on page ??.)

\assignment@number

Like \assignment@title only for the number, and no around part.

```
8244 \newcommand\assignment@number{
8245 \int_compare:nNnTF \l_@@_inclassign_number_int = {-1} {
8246 \int_compare:nNnTF \l_@@_assign_number_int = {-1} {
8247 \arabic{assignment}
8248 } {
8249 \int_use:N \l_@@_assign_number_int
8250 }
8251 }{
8252 \int_use:N \l_@@_inclassign_number_int
8253 }
8254 }
```

 $(\mathit{End \ definition \ for \ } \verb|\assignment@number|. \ \mathit{This \ function \ is \ documented \ on \ page \ \ref{eq:condition}.)}$

With them, we can define the central assignment environment. This has two forms (separated by \ifmultiple) in one we make a title block for an assignment sheet, and in the other we make a section heading and add it to the table of contents. We first define an assignment counter

 ${\tt assignment}$

For the assignment environment we delegate the work to the Cassignment environment that depends on whether multiple option is given.

```
8255 \newenvironment{assignment}[1][]{
8256 \_@@_assignment_args:n { #1 }
8257 %\sref@target
8258 \int_compare:nNnTF \l_@@_assign_number_int = {-1} {
8259 \global\stepcounter{assignment}
8260 }{
\verb| | global \etcounter{assignment}{\end{minipage}} | lint_use: \verb| N \end{minipage} | lint_us
8262 }
8263 \setcounter{problem}{0}
8264 \renewcommand\prob@label[1]{\assignment@number.##1}
8265 \def\current@section@level{\document@hwexamtype}
8266 %\sref@label@id{\document@hwexamtype \thesection}
8267 \begin{@assignment}
8268 }{
8269 \end{@assignment}
8270 }
```

In the multi-assignment case we just use the omdoc environment for suitable sectioning.

```
8271 \def\ass@title{
8272 {\protect\document@hwexamtype}~\arabic{assignment}
%273 \assignment@title{}{\;(){})\;} -- \given@due{}{}
8274
8275 \ifmultiple
8276 \newenvironment{@assignment}{
8277 \bool_if:NTF \l_@@_assign_loadmodules_bool {
8278 \begin{sfragment}[loadmodules]{\ass@title}
8280 \begin{sfragment}{\ass@title}
8281 }
8282 }{
8283 \end{sfragment}
8284 }
for the single-page case we make a title block from the same components.
8286 \newenvironment{@assignment}{
8287 \begin{center}\bf
8288 \Large\@title\strut\\
8289 \document@hwexamtype~\arabic{assignment}\assignment@title{\;}{:\;}{\\}
8290 \large\given@due{--\;}{\;--}
8291 \end{center}
8292 }{}
8293 \fi% multiple
```

40.3 Including Assignments

\in*assignment

This macro is essentially a glorified \include statement, it just sets some internal macros first that overwrite the local points Importantly, it resets the inclassig keys after the input.

```
8294 \keys_define:nn { hwexam / inclassignment } {
%id .str_set_x:N = 1_00_assign_id_str,
