### The STEX3 Package \*

Michael Kohlhase, Dennis Müller FAU Erlangen-Nürnberg

http://kwarc.info/

2022-03-03

#### Abstract

STEX is a collection of LaTeX package that allow to markup documents semantically without leaving the document format, essentially turning LaTeX into a document format for mathematical knowledge management (MKM). STeX augments LaTeX with

- Semantic macros that denote and distinguish between mathematical concepts, operators, etc. independent of their notational presentation,
- A powerful module system that allows for authoring and importing individual fragments containing document text and/or semantic macros, independent of

   and without hard coding – directory paths relative to the current document,
- A mechanism for exporting STEX documents to (modular) XHTML, preserving all the semantic information for semantically informed knowledge management services.

This is the full documentation of STFX. It consists of four parts:

- Part I is a general manual for the STEX package and associated software. It is primarily directed at end-users who want to use STEX to author semantically enriched documents.
- Part II documents the macros provided by the STEX package. It is primarily directed at package authors who want to build on STEX, but can also serve as a reference manual for end-users.
- Part III documents additional packages that build on STEX, primarily its module system. These are not part of the STEX package itself, but useful additions enabled by STEX package functionality.
- $\bullet~$  Part IV is the detailled documentation of the STEX package implementation.

<sup>\*</sup>Version 3.0 (last revised 2022-03-03)

## Part I **Manual**

## What is STEX?

Formal systems for mathematics (such as interactive theorem provers) have the potential to significantly increase both the accessibility of published knowledge, as well as the confidence in its veracity, by rendering the precise semantics of statements machine actionable. This allows for a plurality of added-value services, from semantic search up to verification and automated theorem proving. Unfortunately, their usefulness is hidden behind severe barriers to accessibility; primarily related to their surface languages reminiscent of programming languages and very unlike informal standards of presentation.

STEX minimizes this gap between informal and formal mathematics by integrating formal methods into established and widespread authoring workflows, primarily LATEX, via non-intrusive semantic annotations of arbitrary informal document fragments. That way formal knowledge management services become available for informal documents, accessible via an IDE for authors and via generated *active* documents for readers, while remaining fully compatible with existing authoring workflows and publishing systems.

Additionally, an extensible library of reusable document fragments is being developed, that serve as reference targets for global disambiguation, intermediaries for content exchange between systems and other services.

Every component of the system is designed modularly and extensibly, and thus lay the groundwork for a potential full integration of interactive theorem proving systems into established informal document authoring workflows.

The general STEX workflow combines functionalities provided by several pieces of software:

- $\bullet\,$  The STEX package to use semantic annotations in IATEX documents,
- RusTeX to convert tex sources to (semantically enriched) xhtml,
- The MMT software, that extracts semantic information from the thus generated xhtml and provides semantically informed added value services.

## Quickstart

### 2.1 Setup

#### 2.1.1 The STEX IDE

TODO: VSCode Plugin

#### 2.1.2 Manual Setup

Foregoing on the STFX IDE, we will need several pieces of software; namely:

- The STEX-Package available here<sup>1</sup>. Note, that the CTAN repository for IATEX packages may contain outdated versions of the STEX package, so make sure, that your TEXMF system variable is configured such that the packages available in the linked repository are prioritized over potential default packages that come with your TEX distribution.
- The Mmt System available here<sup>2</sup>. We recommend following the setup routine documented here.
  - Following the setup routine (Step 3) will entail designating a MathHub-directory on your local file system, where the MMT system will look for STEX/MMT content archives.
- To make sure that STEX too knows where to find its archives, we need to set a global system variable MATHHUB, that points to your local MathHub-directory (see chapter 4).
- STEX Archives If we only care about IATEX and generating pdfs, we do not technically need MMT at all; however, we still need the MATHHUB system variable to be set. Furthermore, MMT can make downloading content archives we might want to use significantly easier, since it makes sure that all dependencies of (often highly interrelated) STEX archives are cloned as well.

Once set up, we can run mmt in a shell and download an archive along with all of its dependencies like this: lmh install <name-of-repository>, or a whole group of archives; for example, lmh install smglom will download all smglom archives.

 $<sup>^{1}\</sup>mathrm{EdNote}\colon$  For now, we require the latex3-branch

<sup>&</sup>lt;sup>2</sup>Ednote: For now, we require the sTeX-branch, requiring manually compiling the MMT sources

• RusTeX The Mmt system will also set up RusTeX for you, which is used to generate (semantically annotated) xhtml from tex sources. In lieu of using Mmt, you can also download and use RusTeX directly here.

### 2.2 A First STEX Document

Having set everything up, we can write a first STEX document. As an example, we will use the smglom/calculus and smglom/arithmetics archives, which should be present in the designated MathHub-folder.

The document we will consider is the following:

Compiling this document with pdflatex should yield the output

```
The series \sum_{n=1}^{\infty} \frac{1}{2^n} converges towards 1.
```

Note that the  $\sum$  and  $\infty$ -symbols are highlighted in blue, and the words "series" and "converges" in bold. This signifies that these words and symbols reference STEX symbols formally declared somewhere; associating their presentation in the document with their (formal) definition - i.e. their semantics. The precise way in which they are highlighted (if at all) can of course be customized (see  $^3$ ).

\usemodule

The command \usemodule[some/archive] {modulename} finds some module in the appropriate archive – in the first case (\usemodule[smglom/calculus]{series}), STEX looks for the archive smglom/calculus in our local MathHub-directory (see chapter 4), and in its source-folder for a file series.tex. Since no such file exists, and by default the document is assumed to be in *english*, it picks the file series.en.tex, and indeed, in here we find a statement \begin{smodule}{smodule}{series}.

STEX now reads this file and makes all semantic macros therein available to use, along with all its dependencies. This enables the usage of \infinitesum later on.

Analogously, \usemodule[smglom/arithmetics]{realarith} opens the file realarith.en.tex in the .../smglom/arithmetics/source-folder and makes its contents available, e.g. \realdivide and \realpower.

EdN:3

 $<sup>^3{</sup>m EdNote}$ : somewhere later

\symref \symname

The command \symref{symbolname}{text} marks the text in the second argument as representing the symbolname in the first argument – which is why the word "series" is set in boldface. In the pdf, this is all that happens. In the xhtml (which we will investigate shortly) however, we will note that the word "series" is now annotated with the full URI of the symbol denoting the mathematical concept of a series. In other words, the word is associated with an unambiguous semantics.

Notably, in both cases above (series and converges) the text that references the symbol and the name of the symbol are identical. Since this occurs quite often, the shorthand \symname{converges} would have worked as well, where \symname{foo-bar} behaves exactly like \symref{foo-bar}{foo bar} - i.e. the text is simply the name of the symbol with "-" replaced by a space.

\importmodule

If you investigated the contents of the imported modules (realarith and series) more closely, you'll note that none of them contain a symbol "converges". Yet, we can use \symref to refer to "converges". That is because the symbol converges is found in smglom/calculus/source/sequenceConvergence.en.tex, and series.en.tex contains the line \importmodule{sequenceConvergence}. The \importmodule-statement makes the module referenced available to all documents that include the current module. As such, a "current module" has to exist for \importmodule to work, which is why the command is only allowed within a module-environment.

TODO explain xhtml conversion, MMT compilation (requires an archive...?).

# Using STEX

```
Both the stex package and document class offer the following options:
```

```
lang (\langle language \rangle *) Languages to load with the babel package.

mathhub (\langle directory \rangle) MathHub folder to search for repositories.

sms (\langle boolean \rangle) use persisted mode (not yet implemented).

image (\langle boolean \rangle) passed on to tikzinput.
```

**debug** ( $\langle log\text{-}prefix \rangle *$ ) Logs debugging information with the given prefixes to the terminal, or all if all is given.

TODO: terms documentation
TODO: references documentation

## STEX Archives

### 4.1 The Local MathHub-Directory

\usemodule, \importmodule, \inputref etc. allow for including content modularly without having to specify absolute paths, which would differ between users and machines. Instead, STEX uses archives that determine the global namespaces for symbols and statements and make it possible for STEX to find content referenced via such URIs.

All STEX archives need to exist in the local MathHub-directory. STEX knows where this folder is via one of three means:

- 1. If the STEX package is loaded with the option mathhub=/path/to/mathhub, then STEX will consider /path/to/mathhub as the local MathHub-directory.
- 2. If the mathhub package option is *not* set, but the macro \mathhub exists when the STEX-package is loaded, then this macro is assumed to point to the local MathHub-directory; i.e. \def\mathhub{/path/to/mathhub}\usepackage{stex} will set the MathHub-directory as path/to/mathhub.
- 3. Otherwise, STEX will attempt to retrieve the system variable MATHHUB, assuming it will point to the local MathHub-directory. Since this variant needs setting up only once and is machine-specific (rather than defined in tex code), it is compatible with collaborating and sharing tex content, and hence recommended.

### 4.2 The Structure of STEX Archives

An STEX archive group/name needs to be stored in the directory /path/to/mathhub/group/name; e.g. assuming your local MathHub-directory is set as /user/foo/MathHub, then in order for the smglom/calculus-archive to be found by the STEX system, it needs to be in /user/foo/MathHub/smglom/calculus.

Each such archive needs two subdirectories:

- /source this is where all your tex files go.
- /META-INF a directory containing a single file MANIFEST.MF, the content of which
  we will consider shortly

An additional lib-directory is optional, and is where STEX will look for files included via **\libinput**.

Additionally a *group* of archives group/name may have an additional archive group/meta-inf. If this meta-inf-archive has a /lib-subdirectory, it too will be searched by \libinput from all tex files in any archive in the group/\*-group.

#### 4.3 MANIFEST.MF-Files

The MANIFEST.MF in the META-INF-directory consists of key-value-pairs, instructing STEX (and associated software) of various properties of an archive. For example, the MANIFEST.MF of the smglom/calculus-archive looks like this:

id: smglom/calculus

source-base: http://mathhub.info/smglom/calculus
narration-base: http://mathhub.info/smglom/calculus

 ${\tt dependencies: smglom/arithmetics,smglom/sets,smglom/topology,}$ 

smglom/mv,smglom/linear-algebra,smglom/algebra

responsible: Michael.Kohlhase@FAU.de

title: Elementary Calculus

teaser: Terminology for the mathematical study of change.

description: desc.html

Many of these are in fact ignored by STFX, but some are important:

id: The name of the archive, including its group (e.g. smglom/calculus),

source-base or

ns: The namespace from which all symbol and module URIs in this repository are formed, see (TODO),

narration-base: The namespace from which all document URIs in this repository are formed, see (TODO),

url-base: The URL that is formed as a basis for external references, see (TODO),

dependencies: All archives that this archive depends on. STEX ignores this field, but MMT can pick up on them to resolve dependencies, e.g. for lmh install.

# Creating New Modules and Symbols

#### TODO

TODO: modules documentation TODO: symbols documentation TODO: inheritance documentation

### 5.1 Advanced Structuring Mechanisms

Given modules:

#### Example 2

```
\begin{smodule}{magma}
\symdef{universe}{\comp{\mathcal U}}
\symdef{operation} [args=2,op=\circ]{#1 \comp\circ #2}
\end{smodule}
\begin{smodule}{monoid}
\importmodule{magma}
\symdef{unit}{\comp e}
\end{smodule}
\begin{smodule}{group}
\importmodule{monoid}
\symdef{inverse}{args=1]{{#1}^{\comp{-1}}}}
\end{smodule}
```

```
Module 2:
Module 3:
Module 4:
```

We can form a module for rings by "cloning" an instance of group (for addition) and monoid (for multiplication), respectively, and "glueing them together" to ensure they share the same universe:

#### Example 3

```
\begin{smodule}{ring}
\begin{copymodule}{group}{addition}
\renamedec[name=universe]{universe}{runiverse}
\renamedec[name=plus]{operation}{rplus}
\renamedec[name=uminus]{inverse}{runinus}
\renamedec[name=uminus]{inverse}{runinus}
\end{copymodule}
\notation*{rplus}[plus,op=+,prec=60]{#1 \comp+ #2}
\notation*{rzero}[zero]{\comp0}\notation*{runinus}[uninus,op=-]{\comp- #1}
\begin{copymodule}{monoid}{multiplication}
\assign{universe}{\runiverse}
\renamedec[name=times]{operation}{rtimes}
\renamedec[name=one]{unit}{rone}
\end{copymodule}
\notation*{rtimes}[cdot,op=\cdot,prec=50]{#1 \comp\cdot #2}
\notation*{rtimes}{comp1}
\rest{Test: $\ritimes a{\rplus c{\ritimes de}}$}
\end{smodule}
```

Module 5: Test:  $a \cdot (c + d \cdot e)$ 

TODO: explain donotclone

#### Example 4

```
\begin{smodule}{int}
\symdef{Integers}{\comp{\mathbb Z}}
\symdef{plus}[args=2,op=+]{#1 \comp+ #2}
\symdef{zero}{\comp0}
\symdef{uminus}[args=1,op=-]{\comp-#1}

\begin{interpretmodule}{group}{intisgroup}
\assign{universe}{\Integers}
\assign{operation}{\plus!}
\assign{unit}{zero}
\assign{interpretmodule}
\end{smodule}
\end{smodule}
```

Module 6:

TODO: hwexam documentation

### Stuff

#### 8.1 Modules

\sTeX \stex

Both print this STEX logo.

#### 8.1.1 Semantic Macros and Notations

Semantic macros invoke a formally declared symbol.

To declare a symbol (in a module), we use \symdecl, which takes as argument the name of the corresponding semantic macro, e.g. \symdecl{foo} introduces the macro \foo. Additionally, \symdecl takes several options, the most important one being its arity. foo as declared above yields a *constant* symbol. To introduce an *operator* which takes arguments, we have to specify which arguments it takes.

Module 7: For example, to introduce binary multiplication, we can do \symdecl{mult}[args=2]. We can then supply the semantic macro with arbitrarily many notations, such as \notation{mult}{#1 #2}.

Since usually, a freshly introduced symbol also comes with a notation from the start, the \symdef command combines \symdecl and \notation. So instead of the above, we could have also written

\symdef{mult}[args=2]{#1 #2}

Adding more notations like \notation{mult}[cdot]{#1 \comp{\cdot} #2} or and  $\mathcal {a}\$ 

#### Example 6

```
a \cdot b and a \times b
```

Not using an explicit option with a semantic macro yields the first declared notation, unless change $d^4$ .

Outside of math mode, or by using the starred variant \foo\*, allows to provide a custom notation, where notational (or textual) components can be given explicitly in square brackets.

#### Example 7

```
a*b is the product of a and b
```

In custom mode, prefixing an argument with a star will not print that argument, but still export it to OMDoc:

```
Example 8
```

```
\label{lem:linear_mult} $$ \displaystyle \operatorname{Multiplying} \ \arg *{ \sum_{a \in \mathbb{S}^{b} } \ again \ by \ \arg { b } } \ yields \dots $$
Multiplying again by b yields...
```

The syntax  $*[\langle int \rangle]$  allows switching the order of arguments. For example, given a 2-ary semantic macro \forevery with exemplary notation \forall #1. #2, we can write

#### Example 9

```
\label{lem:comp} $$ \operatorname{comp}_{\alpha g} = 2] \cap {\operatorname{comp}_{\alpha g} [2]{ The proposition $P$} \subset {\operatorname{comp}_{\alpha g} [1]{ x\in A$}} $$
The proposition P holds for every x \in A
```

EdN:4

<sup>&</sup>lt;sup>4</sup>EdNote: TODO

When using \*[n], after reading the provided (nth) argument, the "argument counter" automatically continues where we left off, so the \*[1] in the above example can be omitted.

For a macro with arity > 0, we can refer to the operator *itself* semantically by suffixing the semantic macro with an exclamation point! in either text or math mode. For that reason \notation (and thus \symdef) take an additional optional argument op=, which allows to assign a notation for the operator itself. e.g.

#### Example 10

```
\symdef{add}[args=2,op={+}]{#1 \comp+ #2}
The operator \alpha add! adds two elements, as in \add ab\add ab\adds.

The operator + adds two elements, as in \alpha+b.
```

\* is composable with! for custom notations, as in:

#### Example 11

```
\mult!{\comp{Multiplication}} (denoted by $\mult!*{\comp\cdot}$) is defined by...

Multiplication (denoted by ·) is defined by...
```

The macro \comp as used everywhere above is responsible for highlighting, linking, and tooltips, and should be wrapped around the notation (or text) components that should be treated accordingly. While it is attractive to just wrap a whole notation, this would also wrap around e.g. the arguments themselves, so instead, the user is tasked with marking the notation components themself.

The precise behaviour of \comp is governed by the macro \@comp, which takes two arguments: The tex code of the text (unexpanded) to highlight, and the URI of the current symbol. \@comp can be safely redefined to customize the behaviour.

The starred variant \symdecl\*{foo} does not introduce a semantic macro, but still declares a corresponding symbol. foo (like any other symbol, for that matter) can then be accessed via \STEXsymbol{foo} or (if foo was declared in a module Foo) via \STEXModule{Foo}?{foo}.

both \STEXsymbol and \STEXModule take any arbitrary ending segment of a full URI to determine which symbol or module is meant. e.g. \STEXsymbol{Foo?foo} is also valid, as are e.g. \STEXModule{path?Foo}?{foo} or \STEXsymbol{path?Foo?foo}

There's also a convient shortcut \symref{?foo}{some text} for \STEXsymbol{?foo}! [some text]

#### Other Argument Types

So far, we have stated the arity of a semantic macro directly. This works if we only have "normal" (or more precisely: i-type) arguments. To make use of other argument types, instead of providing the arity numerically, we can provide it as a sequence of characters representing the argument types – e.g. instead of writing args=2, we can equivalently write args=ii, indicating that the macro takes two i-type arguments.

Besides i-type arguments, STEX has two other types, which we will discuss now.

The first are binding (b-type) arguments, representing variables that are bound by the operator. This is the case for example in the above \forevery-macro: The first argument is not actually an argument that the forevery "function" is "applied" to; rather, the first argument is a new variable (e.g. x) that is bound in the subsequent argument. More accurately, the macro should therefore have been implemented thusly:

```
\symdef{forevery}[args=bi]{\forall #1.\; #2}
```

b-type arguments are indistinguishable from i-type arguments within STFX, but are treated very differently in OMDOC and by MMT. More interesting within STEX are a-type arguments, which represent (associative) arguments of flexible arity, which are provided as comma-separated lists. This allows e.g. better representing the \mult-macro above:

#### Example 12

```
a \cdot b \cdot c \cdot d^e \cdot f
```

'As the example above shows, notations get a little more complicated for associative arguments. For every a-type argument, the \notation-macro takes an additional argument that declares how individual entries in an a-type argument list are aggregated. The first notation argument then describes how the aggregated expression is combined into the full representation.

For a more interesting example, consider a flexary operator for ordered sequences in ordered set, that taking arguments  $\{a,b,c\}$  and  $\mathbb{R}$  prints  $a < b < c \in \mathbb{R}$ . This operator takes two arguments (an a-type argument and an i-type argument), aggregates the individuals of the associative argument using \leq, and combines the result with \in and the second argument thusly:

```
Example 13
```

```
a \le b \le c \in \mathbb{R}
```

Finally, B-type arguments combine the functionalities of a and b, i.e. they represent flexary binding operator arguments. 5 6

 $<sup>^5{\</sup>rm EdNote}$  what about e.g. \int \_x\int \_y\int \_z f dx dy dz?

 $<sup>^6\</sup>mathrm{EdNote}\colon$  "decompose" a-type arguments into fixed-arity operators?

#### Precedences

Every notation has an (upwards) operator precedence and for each argument a (downwards) argument precedence used for automated bracketing. For example, a notation for a binary operator \foo could be declared like this:

```
\notation{foo}[prec=200;500x600]{#1 }comp{+} #2}
```

assigning an operator precedence of 200, an argument precedence of 500 for the first argument, and an argument precedence of 600 for the second argument.

SIEX insert brackets thusly: Upon encountering a semantic macro (such as \foo), its operator precedence (e.g. 200) is compared to the current downwards precedence (initially \neginfprec). If the operator precedence is *larger* than the current downwards precedence, parentheses are inserted around the semantic macro.

Notations for symbols of arity 0 have a default precedence of  $\$ infprec, i.e. by default, parentheses are never inserted around constants. Notations for symbols with arity > 0 have a default operator precedence of 0. If no argument precedences are explicitly provided, then by default they are equal to the operator precedence.

Consequently, if some operator A should bind stronger than some operator B, then As operator precedence should be smaller than Bs argument precedences.

For example:

#### Module 9:

#### Example 14

 $a+b\cdot c$  and  $a\cdot (b+c)$ 

#### 8.1.2 Archives and Imports

#### Namespaces

Ideally, STEX would use arbitrary URIs for modules, with no forced relationships between the *logical* namespace of a module and the *physical* location of the file declaring the module – like MMT does things.

Unfortunately, TEX only provides very restricted access to the file system, so we are forced to generate namespaces systematically in such a way that they reflect the physical location of the associated files, so that STEX can resolve them accordingly. Largely, users need not concern themselves with namespaces at all, but for completenesses sake, we describe how they are constructed:

- If \begin{module}{Foo} occurs in a file /path/to/file/Foo[.\(\lang\)].tex which does not belong to an archive, the namespace is file://path/to/file.
- If the same statement occurs in a file /path/to/file/bar[. $\langle lang \rangle$ ].tex, the namespace is file://path/to/file/bar.

In other words: outside of archives, the namespace corresponds to the file URI with the filename dropped iff it is equal to the module name, and ignoring the (optional) language suffix<sup>1</sup>.

If the current file is in an archive, the procedure is the same except that the initial segment of the file path up to the archive's source-folder is replaced by the archive's namespace URI.

#### Paths in Import-Statements

Conversely, here is how namespaces/URIs and file paths are computed in import statements, examplary \importmodule:

- \importmodule{Foo} outside of an archive refers to module Foo in the current namespace. Consequently, Foo must have been declared earlier in the same document or, if not, in a file Foo[. $\langle lang \rangle$ ].tex in the same directory.
- The same statement within an archive refers to either the module Foo declared earlier in the same document, or otherwise to the module Foo in the archive's top-level namespace. In the latter case, is has to be declared in a file Foo [. $\langle lang \rangle$ ].tex directly in the archive's source-folder.
- Similarly, in \importmodule{some/path?Foo} the path some/path refers to either the sub-directory and relative namespace path of the current directory and namespace outside of an archive, or relative to the current archive's top-level namespace and source-folder, respectively.
  - The module Foo must either be declared in the file  $\langle top\text{-}directory \rangle$ /some/path/Foo[. $\langle lang \rangle$ ].tex, or in  $\langle top\text{-}directory \rangle$ /some/path[. $\langle lang \rangle$ ].tex (which are checked in that order).
- Similarly, \importmodule[Some/Archive] {some/path?Foo} is resolved like the previous cases, but relative to the archive Some/Archive in the mathhub-directory.
- Finally, \importmodule{full://uri?Foo} naturally refers to the module Foo in the namespace full://uri. Since the file this module is declared in can not be determined directly from the URI, the module must be in memory already, e.g. by being referenced earlier in the same document.
  - Since this is less compatible with a modular development, using full URIs directly is discouraged.

 $<sup>^{1}</sup>$ which is internally attached to the module name instead, but a user need not worry about that.

# Part II Documentation

# **STEX-Basics**

This sub package provides general set up code, auxiliary methods and abstractions for xhtml annotations.

#### 9.1 Macros and Environments

\sTeX Both print this STEX logo.

\stex\_debug:nn

 $\stex_debug:nn \ \{\langle log-prefix \rangle\} \ \{\langle message \rangle\}$ 

Logs  $\langle message \rangle$ , if the package option debug contains  $\langle log\text{-}prefix \rangle$ .

#### 9.1.1 HTML Annotations

\ifClatexml LATEX2e conditional for LATEXML

LATEXX3 conditionals for LATEXML.

 $\stex_if_do_html_p: \star \\ stex_if_do_html: \underline{\mathit{TF}} \star$ 

Whether to currently produce any HTML annotations (can be false in some advanced structuring environments, for example)

\stex\_suppress\_html:n

Temporarily disables HTML annotations in its argument code

We have four macros for annotating generated HTML (via LATEXML or  $R_{US}T_{E\!\!\!\!/}X)$  with attributes:

Annotates the HTML generated by  $\langle content \rangle$  with

```
property="stex:\langle property\rangle", resource="\langle resource\rangle".
\stex_annotate_invisible:n adds the attributes

stex:visible="false", style="display:none".
\stex_annotate_invisible:nnn combines the functionality of both.

\begin{stex_annotate_env}{\langle property\rangle} \{\langle resource\rangle}\\ \langle content\rangle\\ \end{stex_annotate_env}\\ \end{stex_annotate_env}\\ \langle \stex_annotate_env\rangle\\ \langle \stex_annotate_env\rangle\\ \langle \langle \stex_annotate_env\rangle\\ \langle \lang
```

#### 9.1.2 Babel Languages

\c\_stex\_languages\_prop
\c\_stex\_language\_abbrevs\_prop

Map language abbreviations to their full babel names and vice versa. e.g. \c\_stex\_languages\_prop{en} yields english, and \c\_stex\_language\_abbrevs\_prop{english} yields en.

#### 9.1.3 Auxiliary Methods

\stex\_deactivate\_macro:Nn \stex\_reactivate\_macro:N

 $\verb|\stex_deactivate_macro:Nn| \langle cs \rangle \{ \langle environments \rangle \}|$ 

Makes the macro  $\langle cs \rangle$  throw an error, indicating that it is only allowed in the context of  $\langle environments \rangle$ .

 $\scalebox{stex_reactivate_macro:} \mathbb{N}\langle cs \rangle$  reactivates it again, i.e. this happens ideally in the  $\langle begin \rangle$ -code of the associated environments.

\ignorespacesandpars

ignores white space characters and  $\par$  control sequences. Expands tokens in the process.

# ST<sub>E</sub>X-MathHub

This sub package provides code for handling STEX archives, files, file paths and related methods.

#### 10.1 Macros and Environments

\stex\_kpsewhich:n

\stex\_kpsewhich:n executes kpsewhich and stores the return in \l\_stex\_kpsewhich\_return\_str. This does not require shell escaping.

#### 10.1.1 Files, Paths, URIs

\stex\_path\_from\_string:Nn

 $\stex_path\_from\_string:Nn \langle path-variable \rangle \{\langle string \rangle\}$ 

turns the  $\langle string \rangle$  into a path by splitting it at /-characters and stores the result in  $\langle path-variable \rangle$ . Also applies  $\text{stex\_path\_canonicalize:N}$ .

\stex\_path\_to\_string:NN \stex\_path\_to\_string:N

The inverse; turns a path into a string and stores it in the second argument variable, or leaves it in the input stream.

\stex\_path\_canonicalize:N

Canonicalizes the path provided; in particular, resolves . and . . path segments.

 $\stex_path_if_absolute_p:N * \\stex_path_if_absolute:N$\underline{TF} *$ 

Checks whether the path provided is absolute, i.e. starts with an empty segment

\c\_stex\_pwd\_seq
\c\_stex\_pwd\_str
\c\_stex\_mainfile\_seq
\c\_stex\_mainfile\_str

Store the current working directory as path-sequence and string, respectively, and the (heuristically guessed) full path to the main file, based on the PWD and \jobname.

 $\g_stex\_currentfile\_seq$ 

The file being currently processed (respecting \input etc.)

\stex\_filestack\_push:n
\stex\_filestack\_pop:

Push and pop (repsectively) a file path to the file stack, to keep track of the current file. Are called in hooks file/before and file/after, respectively.

#### 10.1.2 MathHub Archives

\mathhub
\c\_stex\_mathhub\_seq
\c\_stex\_mathhub\_str

We determine the path to the local MathHub folder via one of three means, in order of precedence:

- 1. The mathhub package option, or
- 2. the \mathhub-macro, if it has been defined before the \usepackage{stex}-statement, or
- 3. the MATHHUB system variable.

In all three cases, \c\_stex\_mathhub\_seq and \c\_stex\_mathhub\_str are set accordingly.

#### \l\_stex\_current\_repository\_prop

Always points to the *current* MathHub repository (if we currently are in one). Has the following fields corresponding to the entries in the MANIFEST.MF-file:

id: The name of the archive, including its group (e.g. smglom/calculus),

ns: The content namespace (for modules and symbols),

narr: the narration namespace (for document references),

docurl: The URL that is used as a basis for external references,

deps: All archives that this archive depends on (currently not in use).

#### \stex\_set\_current\_repository:n

Sets the current repository to the one with the provided ID. calls \\_\_stex\_mathhub\_-do\_manifest:n, so works whether this repository's MANIFEST.MF-file has already been read or not.

#### \stex\_require\_repository:n

Calls \\_\_stex\_mathhub\_do\_manifest:n iff the corresponding archive property list does not already exist, and adds a corresponding definition to the .sms-file.

#### \stex\_in\_repository:nn

 $\stex_in_repository:nn{\langle repository-name \rangle}{\langle code \rangle}$ 

Change the current repository to  $\{\langle repository-name \rangle\}$  (or not, if  $\{\langle repository-name \rangle\}$  is empty), and passes its ID on to  $\{\langle code \rangle\}$  as #1. Switches back to the previous repository after executing  $\{\langle code \rangle\}$ .

#### 10.1.3 Using Content in Archives

\mhpath \*

 $\mbox{\colored} \mbox{\colored} \mbox{\color$ 

Expands to the full path of file  $\langle filename \rangle$  in repository  $\langle archive\text{-}ID \rangle$ . Does not check whether the file or the repository exist.

\inputref
\mhinput

 $\input ref[\langle archive-ID \rangle] \{\langle filename \rangle\}$ 

Both \input the file  $\langle filename \rangle$  in archive  $\langle archive\text{-}ID \rangle$  (relative to the source-subdirectory). \mhinput does so directly. \inputref does so within an \begingroup...\endgroup-block, and skips it in html-mode, inserting a reference to the file instead.

Both also set \ifinputref to true.

\addmhbibresource

 $\input{ref} [\langle archive-ID \rangle] {\langle filename \rangle}$ 

Adds a .bib-file  $\langle filename \rangle$  in archive  $\langle archive\text{-}ID \rangle$  (relative to the top-directory of the archive!).

\libinput

 $\left\langle filename \right\rangle$ 

Inputs  $\langle filename \rangle$ .tex from the lib folders in the current archive and the meta-inf-archive of the current archive group(s) (if existent) in descending order. Throws an error if no file by that name exists in any of the relevant lib-folders.

\libusepackage

 $\label{libusepackage} \label{libusepackage} $$ \left( args \right) \left( filename \right) \right) $$$ 

Like  $\ \$  but looks for .sty-files and calls  $\ \$  instead of  $\$  input.

Throws an error, if none or more than one suitable package file is found.

\mhgraphics \cmhgraphics

If the graphicx package is loaded, these macros are defined at \begin{document}.

\mhgraphics takes the same arguments as \includegraphics, with the additional optional key mhrepos. It then resolves the file path in \mhgraphics[mhrepos=Foo/Bar]{foo/bar.png} relative to the source-folder of the Foo/Bar-archive.

\cmhgraphics additional wraps the image in a center-environment.

\lstinputmhlisting \clstinputmhlisting Like \mhgraphics, but only defined if the listings-package is loaded, and with \lstinputlisting instead of \includegraphics.

# ST<sub>E</sub>X-References

This sub package contains code related to links and cross-references

#### 11.1 Macros and Environments

\STEXreftitle

 $\TEXreftitle{\langle some \ title \rangle}$ 

Sets the title of the current document to  $\langle some\ title \rangle$ . A reference to the current document from  $some\ other$  document will then be displayed accordingly. e.g. if \STEXreftitle{foo book} is called, then referencing Definition 3.5 in this document in another document will display Definition 3.5 in foo book.

\stex\_get\_document\_uri:

Computes the current document uri from the current archive's narr-field and its location relative to the archive's source-directory. Reference targets are computed from this URI and the reference-id.

\l\_stex\_current\_docns\_str

Stores its result in \1 stex current docns str

\stex\_get\_document\_url:

Computes the current URL from the current archive's docurl-field and its location relative to the archive's source-directory. Reference targets are computed from this URL and the reference-id, if this document is only included in SMS mode.

\l\_stex\_current\_docurl\_str

Stores its result in \l\_stex\_current\_docurl\_str

#### 11.1.1 Setting Reference Targets

\stex\_ref\_new\_doc\_target:n

 $\stex_ref_new_doc_target:n{\langle id \rangle}$ 

Sets a new reference target with id  $\langle id \rangle$ .

\stex\_ref\_new\_sym\_target:n

 $\stex_ref_new_sym_target:n{\langle uri \rangle}$ 

Sets a new reference target for the symbol  $\langle uri \rangle$ .

#### 11.1.2 Using References

\sref

 $\left[\left\langle opt-args\right\rangle \right]\left\{\left\langle id\right\rangle \right\}$ 

References the label with if  $\langle id \rangle$ . Optional arguments: TODO

\srefsym

 $\verb|\srefsym[|\langle opt-args|\rangle]| \{\langle symbol|\rangle\}|$ 

Like \sref, but references the *canonical label* for the provided symbol. The canonical target is the last of the following occurring in the document:

- A \definiendum or \definame for  $\langle symbol \rangle$ ,
- The sassertion, sexample or sparagraph with for= $\langle symbol \rangle$  that generated  $\langle symbol \rangle$  in the first place, or
- A \sparagraph with type=symdoc and for= $\langle symbol \rangle$ .

\srefsymuri

 $\verb|\srefsymuri{|\langle \mathit{URI} \rangle|} {\langle \mathit{text} \rangle}|$ 

A convenient short-hand for \srefsym[linktext={text}]{URI}, but requires the first argument to be a full URI already. Intended to be used in e.g. \compemph@uri, \defemph@uri, etc.

# **STEX-Modules**

This sub package contains code related to Modules

#### 12.1 Macros and Environments

The content of a module with uri  $\langle \langle URI \rangle \rangle$  is stored in four macros. All modifications of these macros are global:

\c\_stex\_module\_<URI>\_prop

A property list with the following fields:

name The name of the module,

ns the namespace in field ns,

file the file containing the module, as a sequence of path fragments

lang the module's language,

sig the language of the signature module, if the current file is a translation from some other language,

deprecate if this module is deprecated, the module that replaces it,

meta the metatheory of the module.

\c\_stex\_module\_<URI>\_code

The code to execute when this module is activated (i.e. imported), e.g. to set all the semantic macros, notations, etc.

\c\_stex\_module\_<URI>\_constants

The names of all constants declared in the module

\c\_stex\_module\_<URI>\_constants

The full URIs of all modules imported in this module

\l\_stex\_current\_module\_str

\l\_stex\_current\_module\_str always contains the URI of the current module (if existent).

\l\_stex\_all\_modules\_seq

Stores full URIs for all modules currently in scope.

 $\stex_if_in_module_p: \star$ 

Conditional for whether we are currently in a module

 $\stex_if_in_module: \underline{TF} \star$ 

\stex\_if\_module\_exists\_p:n \*

 $\stex_if_module_exists:n_{\overline{TF}} \star$ 

Conditional for whether a module with the provided URI is already known.

\stex\_add\_to\_current\_module:n
\STEXexport

Adds the provided tokens to the \_code control sequence of the current module. \stex\_add\_to\_current\_module:n is used internally, \STEXexport is intended for users and additionally executes the provided code immediately.

#### \stex\_add\_constant\_to\_current\_module:n

Adds the declaration with the provided name to the \_constants control sequence of the current module.

#### \stex\_add\_import\_to\_current\_module:n

Adds the module with the provided full URI to the \_imports control sequence of the current module.

#### \stex\_collect\_imports:n

Iterates over all imports of the provided (full URI of a) module and stores them as a topologically sorted list – including the provided module as the last element – in \l\_stex\_collect\_imports\_seq

#### \stex\_do\_up\_to\_module:n

Code that is exported from module (such as symbol declarations) should be local to the current module. For that reason, ideally all symbol declarations and similar commands should be called directly in the module environment, however, that is not always feasible, e.g. in structural features or sparapraphs. \stex\_do\_up\_to\_module therefore executes the provided code repeatedly in an \aftergroup up until the group level is equal to that of the innermost smodule environment.

#### \stex\_modules\_current\_namespace:

Computes the current namespace as follows:

If the current file is .../source/sub/file.tex in some archive with namespace http://some.namespace/foo, then the namespace of is http://some.namespace/foo/sub/file. Otherwise, the namespace is the absolute file path of the current file (i.e. starting with file:///).

The result is stored in \l\_stex\_modules\_ns\_str. Additionally, the sub path relative to the current repository is stored in \l\_stex\_modules\_subpath\_str.

#### 12.1.1 The smodule environment

module \begin{module}[\langle options \rangle] {\langle name \rangle} \ Opens a new module with name  $\langle name \rangle$ . Options are:

title ( $\langle token \ list \rangle$ ) to display in customizations.

type  $(\langle string \rangle *)$  for use in customizations.

deprecate  $(\langle module \rangle)$  if set, will throw a warning when loaded, urging to use  $\langle module \rangle$  instead.

id  $(\langle string \rangle)$  for cross-referencing.

ns  $(\langle \mathit{URI} \rangle)$  the namespace to use. Should not be used, unless you know precisely what you're doing. If not explicitly set, is computed using \stex\_modules\_current\_namespace:.

lang  $(\langle language \rangle)$  if not set, computed from the current file name (e.g. foo.en.tex).

sig (\language\rangle) if the current file is a translation of a file with the same base name but a different language suffix, setting sig=<lamp> will preload the module from that language file. This helps ensuring that the (formal) content of both modules is (almost) identical across languages and avoids duplication.

creators ( $\langle string \rangle *$ ) names of the creators.

contributors ( $\langle string \rangle *$ ) names of contributors.

**srccite**  $(\langle string \rangle)$  a source citation for the content of this module.

\stex\_module\_setup:nn

 $\stex_module_setup:nn{\langle params \rangle}{\langle name \rangle}$ 

Sets up a new module with name  $\langle name \rangle$  and optional parameters  $\langle params \rangle$ . In particular, sets  $\l_stex_current_module_str$  appropriately.

\stexpatchmodule

 $\stexpatch{module [\langle type \rangle] \{\langle begincode \rangle\} \{\langle endcode \rangle\}}$ 

Customizes the presentation for those smodule-environments with type= $\langle type \rangle$ , or all others if no  $\langle type \rangle$  is given.

\STEXModule

 $\verb|\STEXModule {| \langle fragment \rangle|}|$ 

Attempts to find a module whose URI ends with  $\langle fragment \rangle$  in the current scope and passes the full URI on to \stex\_invoke\_module:n.

\stex\_invoke\_module:n

Invoked by \STEXModule. Needs to be followed either by !\macro or ?{ $\langle symbolname \rangle$ }. In the first case, it stores the full URI in \macro; in the second case, it invokes the symbol  $\langle symbolname \rangle$  in the selected module.

\stex\_activate\_module:n

Activate the module with the provided URI; i.e. executes all macro code of the module's  $\_code$ -macro (does nothing if the module is already activated in the current context) and adds the module to  $\\le stex_all_modules_seq$ .

# STeX-Module Inheritance

Code related to Module Inheritance, in particular sms mode.

#### 13.1 Macros and Environments

#### 13.1.1 SMS Mode

"SMS Mode" is used when loading modules from external tex files. It deactivates any output and ignores all T<sub>E</sub>X commands not explicitly allowed via the following lists – all of which either declare module content or are needed in order to declare module content:

#### $\g_stex_smsmode_allowedmacros_tl$

Macros that are executed as is; i.e. sms mode continues immediately after. These macros may not take any arguments or otherwise gobble tokens.

 $Initially: \verb|\makeatletter|, \verb|\makeatother|, \verb|\ExplSyntaxOn|, \verb|\ExplSyntaxOff|.$ 

#### $\verb|\g_stex_smsmode_allowedmacros_escape_tl|\\$

Macros that are executed and potentially gobble up further tokens. These macros need to make sure, that the very last token they ultimately expand to is \stex\_smsmode\_do:.

Initially: \symdecl, \notation, \symdef, \importmodule, \STEXexport, \inlineass, \inlinedef, \inlineex, \endinput, \setnotation, \copynotation.

#### $\g_stex_smsmode_allowedenvs_seq$

The names of environments that should be allowed in SMS mode. The corresponding \begin-statements are treated like the macros in \g\_stex\_smsmode\_allowedmacros\_-escape\_tl, so \stex\_smsmode\_do: needs to be the last token in the \begin-code. Since \end-statements take no arguments anyway, those are called directly and sms mode continues afterwards.

 $Initially: \verb|smodule|, copymodule|, interpretmodule|, \verb|sdefinition|, sexample|, \verb|sassertion|, sparagraph|.$ 

\stex\_if\_smsmode\_p: \*
\stex\_if\_smsmode:TF \*

Tests whether SMS mode is currently active.

\stex\_file\_in\_smsmode:nn

Executes  $\langle code \rangle$  in SMS mode, followed by the content of  $\langle filename \rangle$ .  $\langle code \rangle$  can be used e.g. to set the current repository, and is executed within a new tex group, and the same group as the file content.

\stex\_smsmode\_do:

Starts gobbling tokens until one is encountered that is allowed in SMS mode.

#### 13.1.2 Imports and Inheritance

\importmodule

 $\in portmodule[\langle archive-ID \rangle] \{\langle module-path \rangle\}$ 

Imports a module by reading it from a file and "activating" it. STEX determines the module and its containing file by passing its arguments on to \stex\_import\_module\_-path:nn.

\usemodule

 $\in \protection [(archive-ID)] {(module-path)}$ 

Like \importmodule, but does not export its contents; i.e. including the current module will not activate the used module

\stex\_import\_module\_uri:nn

 $\stex_import_module\_uri:nn {\langle archive-ID \rangle} {\langle module-path \rangle}$ 

Determines the URI of a module by splitting  $\langle module\text{-}path \rangle$  into  $\langle path \rangle$ ? $\langle name \rangle$ . If  $\langle module\text{-}path \rangle$  does not contain a ?-character, we consider it to be the  $\langle name \rangle$ , and  $\langle path \rangle$  to be empty.

If  $\langle archive\text{-}ID \rangle$  is empty, it is automatically set to the ID of the current archive (if one exists).

- 1. If  $\langle archive\text{-}ID \rangle$  is empty:
  - (a) If  $\langle path \rangle$  is empty, then  $\langle name \rangle$  must have been declared earlier in the same file and retrievable from  $\gspace{\gray \gray \g$
  - (b) If  $\langle path \rangle$  is not empty, it must point to the relative path of the containing file as well as the namespace.

#### 2. Otherwise:

(a) If  $\langle path \rangle$  is empty, then  $\langle name \rangle$  must have been declared earlier in the same file and retrievable from  $\g_stex_modules_in_file_seq$ , or a file with name  $\langle name \rangle . \langle lang \rangle . tex$  must exist in the top source folder of the archive, containing a module  $\langle name \rangle .$ 

That module should lie directly in the namespace of the archive.

(b) If  $\langle path \rangle$  is not empty, it must point to the path of the containing file as well as the namespace, relative to the namespace of the archive.

If a module by that namespace exists, it is returned. Otherwise, we call \stex\_require\_module:nn on the source directory of the archive to find the file.

```
\l_stex_import_name_str
\l_stex_import_archive_str
\l_stex_import_path_str
\l_stex_import_ns_str
```

stores the result in these four variables.

Checks whether a module with URI  $\langle ns \rangle$ ? $\langle name \rangle$  already exists. If not, it looks for a plausible file that declares a module with that URI.

Finally, activates that module by executing its \_code-macro.

# STEX-Symbols

Code related to symbol declarations and notations

#### 14.1 Macros and Environments

\symdecl

 $\symdecl{\langle macroname \rangle}[\langle args \rangle]$ 

Declares a new symbol with semantic macro \macroname. Optional arguments are:

- name: An (OMDoc) name. By default equal to  $\langle macroname \rangle$ .
- type: An (ideally semantic) term. Not used by STEX, but passed on to MMT for semantic services.
- local: A boolean (by default false). If set, this declaration will not be added to the module content, i.e. importing the current module will not make this declaration available.
- args: Specifies the "signature" of the semantic macro. Can be either an integer  $0 \le n \le 9$ , or a (more precise) sequence of the following characters:
  - i a "normal" argument, e.g. \symdecl{plus}[args=ii] allows for \plus{2}{2}.
  - a an associative argument; i.e. a sequence of arbitrarily many arguments provided as a comma-separated list, e.g. \symdecl{plus}[args=a] allows for \plus{2,2,2}.
  - b a variable argument. Is treated by STEX like an i-argument, but an application is turned into an OMBind in OMDOC, binding the provided variable in the subsequent arguments of the operator; e.g. \symdecl{forall}[args=bi] allows for \forall{x\in\Nat}{x\geq0}.

\stex\_symdecl\_do:n

Implements the core functionality of \symdecl, and is called by \symdecl and \symdef. Ultimately stores the symbol  $\langle \mathit{URI} \rangle$  in the property list \l\_stex\_symdecl\_ $\langle \mathit{URI} \rangle$ \_prop with fields:

- name (string),
- module (string),
- notations (sequence of strings; initially empty),
- local (boolean),
- type (token list),
- args (string of is, as and bs),
- arity (integer string),
- assocs (integer string; number of associative arguments),

\stex\_all\_symbols:n

Iterates over all currently available symbols. Requires two \seq\_map\_break: to break fully.

\stex\_get\_symbol:n

Computes the full URI of a symbol from a macro argument, e.g. the macro name, the macro itself, the full URI...

\notation

 $\notation[\langle args \rangle] \{\langle symbol \rangle\} \{\langle notations^+ \rangle\}$ 

Introduces a new notation for  $\langle symbol \rangle$ , see \stex\_notation\_do:nn

\stex\_notation\_do:nn

 $\stex_notation_do:nn\{\langle \mathit{URI}\rangle\}\{\langle notations^+\rangle\}$ 

Implements the core functionality of  $\notation$ , and is called by  $\notation$  and  $\symdef$ .

Ultimately stores the notation in the property list  $\g_stex_notation_{\URI}\#\langle variant\rangle\#\langle lang\rangle_{\prop}$  with fields:

- symbol (URI string),
- language (string),
- variant (string),
- opprec (integer string),
- argprecs (sequence of integer strings)

\symdef

 $\symdef[\langle args \rangle] \{\langle symbol \rangle\} \{\langle notations^+ \rangle\}$ 

Combines \symdecl and \notation by introducing a new symbol and assigning a new notation for it.

# ST<sub>E</sub>X-Terms

Code related to symbolic expressions, typesetting notations, notation components, etc.

#### 15.1 Macros and Environments

\STEXsymbol

Uses \stex\_get\_symbol:n to find the symbol denoted by the first argument and passes the result on to \stex\_invoke\_symbol:n

\symref

 $\symref{\langle symbol \rangle} {\langle text \rangle}$ 

shortcut for  $\STEXsymbol{\langle symbol \rangle}! [\langle text \rangle]$ 

\stex\_invoke\_symbol:n

Executes a semantic macro. Outside of math mode or if followed by \*, it continues to \stex\_term\_custom:nn. In math mode, it uses the default or optionally provided notation of the associated symbol.

If followed by !, it will invoke the symbol *itself* rather than its application (and continue to \stex\_term\_custom:nn), i.e. it allows to refer to \plus![addition] as an operation, rather than \plus[addition of]{some}{terms}.

\\_stex\_term\_math\_oms:nnnn \\_stex\_term\_math\_oma:nnnn \\_stex\_term\_math\_omb:nnnn  $\langle \mathit{URI} \rangle \langle \mathit{fragment} \rangle \langle \mathit{precedence} \rangle \langle \mathit{body} \rangle$ 

Annotates  $\langle body \rangle$  as an OMDoc-term (OMID, OMA or OMBIND, respectively) with head symbol  $\langle URI \rangle$ , generated by the specific notation  $\langle fragment \rangle$  with (upwards) operator precedence  $\langle precedence \rangle$ . Inserts parentheses according to the current downwards precedence and operator precedence.

\\_stex\_term\_math\_arg:nnn

 $\stex_term_arg:nnn\langle int \rangle\langle prec \rangle\langle body \rangle$ 

Annotates  $\langle body \rangle$  as the  $\langle int \rangle$ th argument of the current OMA or OMBIND, with (downwards) argument precedence  $\langle prec \rangle$ .

Annotates  $\langle body \rangle$  as the  $\langle int \rangle$ th (associative) sequence argument (as comma-separated list of terms) of the current OMA or OMBIND, with (downwards) argument precedence  $\langle prec \rangle$  and associative notation  $\langle notation \rangle$ .

\infprec \neginfprec

Maximal and minimal notation precedences.

\dobrackets

\dobrackets  $\{\langle body \rangle\}$ 

Puts  $\langle body \rangle$  in parentheses; scaled if in display mode unscaled otherwise. Uses the current STEX brackets (by default ( and )), which can be changed temporarily using \withbrackets.

\withbrackets

\withbrackets  $\langle left \rangle \langle right \rangle \{\langle body \rangle\}$ 

Temporarily (i.e. within  $\langle body \rangle$ ) sets the brackets used by SIEX for automated bracketing (by default ( and )) to  $\langle left \rangle$  and  $\langle right \rangle$ .

Note that  $\langle left \rangle$  and  $\langle right \rangle$  need to be allowed after \left and \right in displaymode.

\stex\_term\_custom:nn

 $\t \sum_{c} \operatorname{lem_custom:nn} \{\langle \mathit{URI} \rangle\} \{\langle \mathit{args} \rangle\}$ 

Implements custom one-time notation. Invoked by \stex\_invoke\_symbol:n in text mode, or if followed by \* in math mode, or whenever followed by !.

\stex\_highlight\_term:nn

 $\stex_highlight_term:nn{\langle \mathit{URI}\rangle}{\langle \mathit{args}\rangle}$ 

Establishes a context for \comp. Stores the URI in a variable so that \comp knows which symbol governs the current notation.

\comp
\compemph
\compemph@uri
\defemph
\defemph@uri
\symrefemph
\symrefemph
\varemph
\varemph
\varemph@uri

 $\operatorname{\mathbb{Q}}_{args}$ 

Marks  $\langle args \rangle$  as a notation component of the current symbol for highlighting, linking,

The precise behavior is governed by \@comp, which takes as additional argument the URI of the current symbol. By default, \@comp adds the URI as a PDF tooltip and colors the highlighted part in blue.

\@defemph behaves like \@comp, and can be similarly redefined, but marks an expression as definiendum (used by \definiendum)

\STEXinvisible

Exports its argument as OMDoc (invisible), but does not produce PDF output. Useful e.g. for semantic macros that take arguments that are not part of the symbolic notation.

# STEX-Proofs: Structural Markup for Proofs

The sproof package is part of the STEX collection, a version of TEX/LATEX that allows to markup TEX/LATEX documents semantically without leaving the document format, essentially turning TEX/LATEX into a document format for mathematical knowledge management (MKM).

This package supplies macros and environment that allow to annotate the structure of mathematical proofs in  $ST_EX$  files. This structure can be used by MKM systems for added-value services, either directly from the  $ST_EX$  sources, or after translation.

# Contents

#### 18.1 Introduction

The sproof (semantic proofs) package supplies macros and environment that allow to annotate the structure of mathematical proofs in STEX files. This structure can be used by MKM systems for added-value services, either directly from the STEX sources, or after translation. Even though it is part of the STEX collection, it can be used independently, like it's sister package statements.

STEX is a version of TEX/ETEX that allows to markup TEX/ETEX documents semantically without leaving the document format, essentially turning TEX/ETEX into a document format for mathematical knowledge management (MKM).

```
\begin{sproof}[id=simple-proof]
   {We prove that \sum_{i=1}^n{2i-1}=n^{2} by induction over n}
  \begin{spfcases}{For the induction we have to consider the following cases:}
   \begin{spfcase}{$n=1$}
    \begin{spfstep}[type=inline] then we compute $1=1^2$\end{spfstep}
   \end{spfcase}
   \begin{spfcase}{$n=2$}
      \begin{sproofcomment}[type=inline]
       This case is not really necessary, but we do it for the
        fun of it (and to get more intuition).
      \end{sproofcomment}
      \begin{spfstep}[type=inline] We compute $1+3=2^{2}=4$.\end{spfstep}
   \end{spfcase}
   \begin{spfcase}{$n>1$}
      \begin{spfstep}[type=assumption,id=ind-hyp]
       Now, we assume that the assertion is true for a certain $k\geq 1$,
        i.e. \sum_{i=1}^k{(2i-1)}=k^{2}.
      \end{spfstep}
      \begin{sproofcomment}
       We have to show that we can derive the assertion for $n=k+1$ from
       this assumption, i.e. \sum_{i=1}^{k+1}{(2i-1)}=(k+1)^{2}.
      \end{sproofcomment}
      \begin{spfstep}
        We obtain \sum_{i=1}^{k+1}{2i-1}=\sum_{i=1}^{k}{2i-1}+2(k+1)-1
        \begin{justification} [method=arith:split-sum]
         by splitting the sum.
        \end{justification}
      \end{spfstep}
      \begin{spfstep}
        Thus we have \sum_{i=1}^{k+1}{(2i-1)}=k^2+2k+1
        \begin{justification} [method=fertilize]
          by inductive hypothesis.
        \end{justification}
      \end{spfstep}
      \begin{spfstep}[type=conclusion]
       We can \ensuremath{\verb|begin{justification}| [method=simplify] simplify\end{justification}}
       the right-hand side to {k+1}^2, which proves the assertion.
      \end{spfstep}
   \end{spfcase}
    \begin{spfstep}[type=conclusion]
      We have considered all the cases, so we have proven the assertion.
    \end{spfstep}
  \end{spfcases}
\end{sproof}
```

Example 1: A very explicit proof, marked up semantically

We will go over the general intuition by way of our running example (see Figure 1 for the source and Figure 2 for the formatted result).<sup>7</sup>

<sup>&</sup>lt;sup>7</sup>EDNOTE: talk a bit more about proofs and their structure,... maybe copy from OMDoc spec.

#### 18.2 The User Interface

#### 18.2.1 Package Options

showmeta

The sproof package takes a single option: showmeta. If this is set, then the metadata keys are shown (see [Kohlhase:metakeys] for details and customization options).

#### 18.2.2 Proofs and Proof steps

sproof

The proof environment is the main container for proofs. It takes an optional KeyVal argument that allows to specify the id (identifier) and for (for which assertion is this a proof) keys. The regular argument of the proof environment contains an introductory comment, that may be used to announce the proof style. The proof environment contains a sequence of \step, proofcomment, and pfcases environments that are used to markup the proof steps. The proof environment has a variant Proof, which does not use the proof end marker. This is convenient, if a proof ends in a case distinction, which brings it's own proof end marker with it. The Proof environment is a variant of proof that does not mark the end of a proof with a little box; presumably, since one of the subproofs already has one and then a box supplied by the outer proof would generate an otherwise empty line. The \spfidea macro allows to give a one-paragraph description of the proof idea.

sProof

\spfidea

(Spilace

spfsketch

For one-line proof sketches, we use the \spfsketch macro, which takes the KeyVal argument as sproof and another one: a natural language text that sketches the proof.

spfstep

Regular proof steps are marked up with the step environment, which takes an optional KeyVal argument for annotations. A proof step usually contains a local assertion (the text of the step) together with some kind of evidence that this can be derived from already established assertions.

Note that both \premise and \justarg can be used with an empty second argument to mark up premises and arguments that are not explicitly mentioned in the text.

#### 18.2.3 Justifications

justification

This evidence is marked up with the justification environment in the sproof package. This environment totally invisible to the formatted result; it wraps the text in the proof step that corresponds to the evidence. The environment takes an optional KeyVal argument, which can have the method key, whose value is the name of a proof method (this will only need to mean something to the application that consumes the semantic annotations). Furthermore, the justification can contain "premises" (specifications to assertions that were used justify the step) and "arguments" (other information taken into account by the proof method).

\premise

The \premise macro allows to mark up part of the text as reference to an assertion that is used in the argumentation. In the example in Figure 1 we have used the \premise macro to identify the inductive hypothesis.

\justarg

The \justarg macro is very similar to \premise with the difference that it is used to mark up arguments to the proof method. Therefore the content of the first argument is interpreted as a mathematical object rather than as an identifier as in the case of \premise. In our example, we specified that the simplification should take place on the right hand side of the equation. Other examples include proof methods that instantiate. Here we would indicate the substituted object in a \justarg macro.

Proof: We prove that ∑<sub>i=1</sub><sup>n</sup> 2i - 1 = n² by induction over n
1. For the induction we have to consider the following cases:
1.1. n = 1: then we compute 1 = 1²
1.2. n = 2: This case is not really necessary, but we do it for the fun of it (and to get more intuition). We compute 1 + 3 = 2² = 4
1.3. n > 1:
1.3.1. Now, we assume that the assertion is true for a certain k ≥ 1, i.e. ∑<sub>i=1</sub><sup>k</sup> (2i - 1) = k².
1.3.2. We have to show that we can derive the assertion for n = k + 1 from this assumption, i.e. ∑<sub>i=1</sub><sup>k+1</sup> (2i - 1) = (k + 1)².
1.3.3. We obtain ∑<sub>i=1</sub><sup>k+1</sup> (2i - 1) = ∑<sub>i=1</sub><sup>k</sup> (2i - 1) + 2(k + 1) - 1 by splitting the sum
1.3.4. Thus we have ∑<sub>i=1</sub><sup>k+1</sup> (2i - 1) = k² + 2k + 1 by inductive hypothesis.
1.3.5. We can simplify the right-hand side to (k + 1)², which proves the assertion. □
1.4. We have considered all the cases, so we have proven the assertion.

Example 2: The formatted result of the proof in Figure 1

#### 18.2.4 Proof Structure

subproof

method

The pfcases environment is used to mark up a subproof. This environment takes an optional KeyVal argument for semantic annotations and a second argument that allows to specify an introductory comment (just like in the proof environment). The method key can be used to give the name of the proof method executed to make this subproof.

spfcases

The pfcases environment is used to mark up a proof by cases. Technically it is a variant of the subproof where the method is by-cases. Its contents are spfcase environments that mark up the cases one by one.

spfcase

The content of a pfcases environment are a sequence of case proofs marked up in the pfcase environment, which takes an optional KeyVal argument for semantic annotations. The second argument is used to specify the the description of the case under consideration. The content of a pfcase environment is the same as that of a proof, i.e. steps, proofcomments, and pfcases environments. \spfcasesketch is a variant of the spfcase environment that takes the same arguments, but instead of the spfsteps in the body uses a third argument for a proof sketch.

sproofcomment

\spfcasesketch

The proofcomment environment is much like a step, only that it does not have an object-level assertion of its own. Rather than asserting some fact that is relevant for the proof, it is used to explain where the proof is going, what we are attempting to to, or what we have achieved so far. As such, it cannot be the target of a \premise.

#### 18.2.5 Proof End Markers

Traditionally, the end of a mathematical proof is marked with a little box at the end of the last line of the proof (if there is space and on the end of the next line if there isn't), like so:

\sproofend

\sProofEndSymbol

The sproof package provides the \sproofend macro for this. If a different symbol for the proof end is to be used (e.g. q.e.d), then this can be obtained by specifying it using the \sProofEndSymbol configuration macro (e.g. by specifying \sProofEndSymbol{q.e.d}).

Some of the proof structuring macros above will insert proof end symbols for subproofs, in most cases, this is desirable to make the proof structure explicit, but sometimes this wastes space (especially, if a proof ends in a case analysis which will supply its own proof end marker). To suppress it locally, just set proofend={} in them or use use \sProofEndSymbol{}.

#### 18.2.6 Configuration of the Presentation

Finally, we provide configuration hooks in Figure 1 for the keywords in proofs. These are mainly intended for package authors building on statements, e.g. for multi-language support.<sup>8</sup>. The proof step labels can be customized via the \pstlabelstyle macro:

Environment	configuration macro	value
sproof	\spf@proof@kw	Proof
sketchproof	\spf@sketchproof@kw	Proof Sketch

Figure 1: Configuration Hooks for Semantic Proof Markup

\pstlabelstyle

EdN:8

 $\protect\$  sets the style; see Figure ?? for an overview of styles. Package writers can add additional styles by adding a macro  $\protect\$  that takes

<sup>&</sup>lt;sup>8</sup>Ednote: we might want to develop an extension sproof-babel in the future.

two arguments: a comma-separated list of ordinals that make up the prefix and the current ordinal. Note that comma-separated lists can be conveniently iterated over by the  $\LaTeX$  \@for...:=...\do{...} macro; see Figure ?? for examples.

#### 18.3 Limitations

In this section we document known limitations. If you want to help alleviate them, please feel free to contact the package author. Some of them are currently discussed in the  $ST_EX$  issue tracker at [sTeX].

- 1. The numbering scheme of proofs cannot be changed. It is more geared for teaching proof structures (the author's main use case) and not for writing papers. reported by Tobias Pfeiffer (fixed)
- 2. currently proof steps are formatted by the LATEX description environment. We would like to configure this, e.g. to use the inparaenum environment for more condensed proofs. I am just not sure what the best user interface would be I can imagine redefining an internal environment spf@proofstep@list or adding a key prooflistenv to the proof environment that allows to specify the environment directly. Maybe we should do both.

# STEX-Metatheory

The default meta theory for an STEX module. Contains symbols so ubiquitous, that it is virtually impossible to describe any flexiformal content without them, or that are required to annotate even the most primitive symbols with meaningful (foundation-independent) "type"-annotations, or required for basic structuring principles (theorems, definitions).

Foundations should ideally instantiate these symbols with their formal counterparts, e.g. isa corresponds to a typing operation in typed setting, or the  $\in$ -operator in settheoretic contexts; bind corresponds to a universal quantifier in (nth-order) logic, or a  $\Pi$  in dependent type theories.

# document-structure: Semantic Markup for Open Mathematical Documents in LATEX

The document-structure package is part of the  $\mbox{ST}_{E}X$  collection, a version of  $\mbox{T}_{E}X/\mbox{L}^{A}\mbox{T}_{E}X$  that allows to markup  $\mbox{T}_{E}X/\mbox{L}^{A}\mbox{T}_{E}X$  documents semantically without leaving the document format, essentially turning  $\mbox{T}_{E}X/\mbox{L}^{A}\mbox{T}_{E}X$  into a document format for mathematical knowledge management (MKM).

This package supplies an infrastructure for writing OMDoc documents in LATEX. This includes a simple structure sharing mechanism for STEX that allows to to move from a copy-and-paste document development model to a copy-and-reference model, which conserves space and simplifies document management. The augmented structure can be used by MKM systems for added-value services, either directly from the STEX sources, or after translation.

#### 21.1 Introduction

STEX is a version of TEX/IATEX that allows to markup TEX/IATEX documents semantically without leaving the document format, essentially turning TEX/IATEX into a document format for mathematical knowledge management (MKM). The package supports direct translation to the OMDoc format [Koh06]

The document-structure package supplies macros and environments that allow to label document fragments and to reference them later in the same document or in other documents. In essence, this enhances the document-as-trees model to documents-as-directed-acyclic-graphs (DAG) model. This structure can be used by MKM systems for added-value services, either directly from the STEX sources, or after translation. Currently, trans-document referencing provided by this package can only be used in the STEX collection.

DAG models of documents allow to replace the "Copy and Paste" in the source document with a label-and-reference model where document are shared in the document

source and the formatter does the copying during document formatting/presentation.<sup>9</sup>

#### 21.2 The User Interface

The document-structure package generates two files: document-structure.cls, and document-structure.sty. The OMDoc class is a minimally changed variant of the standard article class that includes the functionality provided by document-structure.sty. The rest of the documentation pertains to the functionality introduced by document-structure.sty.

#### 21.2.1 Package and Class Options

The document-strcture class accept the following options:

class=(name)	$load \langle name \rangle$ .cls instead of article.cls
topsect= $\langle sect \rangle$	The top-level sectioning level; the default for $\langle sect \rangle$ is section
showignores	show the the contents of the ignore environment after all
showmeta	show the metadata; see metakeys.sty
showmods	show modules; see modules.sty
extrefs	allow external references; see sref.sty
defindex	index definienda; see statements.sty
minimal	for testing; do not load any STEX packages

The document-structure package accepts the same except the first two.

#### 21.2.2 Document Structure

document documentkeys

The top-level document environment can be given key/value information by the \documentkeys macro in the preamble<sup>2</sup>. This can be used to give metadata about the document. For the moment only the id key is used to give an identifier to the omdoc element resulting from the LATEXML transformation.

sfragment

id creators contributors short loadmodules The structure of the document is given by the omgroup environment just like in OM-Doc. In the LATEX route, the omgroup environment is flexibly mapped to sectioning commands, inducing the proper sectioning level from the nesting of omgroup environments. Correspondingly, the omgroup environment takes an optional key/value argument for metadata followed by a regular argument for the (section) title of the omgroup. The optional metadata argument has the keys id for an identifier, creators and contributors for the Dublin Core metadata [DCM03]; see [Koh20a] for details of the format. The short allows to give a short title for the generated section. If the title contains semantic macros, they need to be protected by \protect, and we need to give the loadmodules key it needs no value. For instance we would have

```
\begin{smodule}{foo}
\symdef{bar}{B^a_r}
```

\begin{sfragment}[id=sec.barderiv,loadmodules]{Introducing \$\protect\bar\$ Derivation

 $<sup>^9\</sup>mathrm{EdNote}$ : integrate with latexml's XMRef in the Math mode.

<sup>&</sup>lt;sup>2</sup>We cannot patch the document environment to accept an optional argument, since other packages we load already do; pity.

blindfragment

STEX automatically computes the sectioning level, from the nesting of omgroup environments. But sometimes, we want to skip levels (e.g. to use a subsection\* as an introduction for a chapter). Therefore the document-structure package provides a variant blindomgroup that does not produce markup, but increments the sectioning level and logically groups document parts that belong together, but where traditional document markup relies on convention rather than explicit markup. The blindomgroup environment is useful e.g. for creating frontmatter at the correct level. Example 3 shows a typical setup for the outer document structure of a book with parts and chapters. We use two levels of blindomgroup:

- The outer one groups the introductory parts of the book (which we assume to have a sectioning hierarchy topping at the part level). This blindomgroup makes sure that the introductory remarks become a "chapter" instead of a "part".
- Th inner one groups the frontmatter<sup>3</sup> and makes the preface of the book a section-level construct. Note that here the display=flow on the omgroup environment prevents numbering as is traditional for prefaces.

```
\begin{document}
\begin{blindfragment}
\begin{blindfragment}
\begin{frontmatter}
\maketitle\newpage
\begin{sfragment}[display=flow]{Preface}
... <<pre><<pre>...
\end{sfragment}
\clearpage\setcounter{tocdepth}{4}\tableofcontents\clearpage
\end{frontmatter}
\end{blindfragment}
... <<introductory remarks>> ...
\end{blindfragment}
\begin{sfragment}{Introduction}
... <<intro>> ...
\end{sfragment}
... <<more chapters>> ...
\bibliographystyle{alpha}\bibliography{kwarc}
```

\end{document} Example 3: A typical Document Structure of a Book

\skipomgroup

The \skipomgroup "skips an omgroup", i.e. it just steps the respective sectioning counter. This macro is useful, when we want to keep two documents in sync structurally, so that section numbers match up: Any section that is left out in one becomes a \skipomgroup.

\currentsectionlevel \CurrentSectionLevel The \currentsectionlevel macro supplies the name of the current sectioning level, e.g. "chapter", or "subsection". \CurrentSectionLevel is the capitalized variant. They are useful to write something like "In this \currentsectionlevel, we will..." in an omgroup environment, where we do not know which sectioning level we will end up.

 $<sup>^3</sup>$ We shied away from redefining the **frontmatter** to induce a blindom group, but this may be the "right" way to go in the future.

#### 21.2.3 Ignoring Inputs

 $\begin{array}{c} \text{ignore} \\ \text{showignores} \end{array}$ 

The ignore environment can be used for hiding text parts from the document structure. The body of the environment is not PDF or DVI output unless the showignores option is given to the document-structure class or package. But in the generated OMDoc result, the body is marked up with a ignore element. This is useful in two situations. For

editing One may want to hide unfinished or obsolete parts of a document

narrative/content markup In STEX we mark up narrative-structured documents. In the generated OMDoc documents we want to be able to cache content objects that are not directly visible. For instance in the statements package [Koh20d] we use the \inlinedef macro to mark up phrase-level definitions, which verbalize more formal definitions. The latter can be hidden by an ignore and referenced by the verbalizes key in \inlinedef.

\prematurestop

\afterprematurestop

For prematurely stopping the formatting of a document, STEX provides the \prematurestop macro. It can be used everywhere in a document and ignores all input after that – backing out of the omgroup environment as needed. After that – and before the implicit \end{document} it calls the internal \afterprematurestop, which can be customized to do additional cleanup or e.g. print the bibliography.

\prematurestop is useful when one has a driver file, e.g. for a course taught multiple years and wants to generate course notes up to the current point in the lecture. Instead of commenting out the remaining parts, one can just move the \prematurestop macro. This is especially useful, if we need the rest of the file for processing, e.g. to generate a theory graph of the whole course with the already-covered parts marked up as an overview over the progress; see import\_graph.py from the lmhtools utilities [LMH].

#### 21.2.4 Structure Sharing

\STRlabel

The \STR1abel macro takes two arguments: a label and the content and stores the the content for later use by \STRcopy[ $\langle URL \rangle$ ] { $\langle label \rangle$ }, which expands to the previously stored content. If the \STR1abel macro was in a different file, then we can give a URL  $\langle URL \rangle$  that lets LATEXML generate the correct reference.

\STRsemantics

EdN:10

The \STRlabel macro has a variant \STRsemantics, where the label argument is optional, and which takes a third argument, which is ignored in LATEX. This allows to specify the meaning of the content (whatever that may mean) in cases, where the source document is not formatted for presentation, but is transformed into some content markup format.<sup>10</sup>

#### 21.2.5 Global Variables

Text fragments and modules can be made more re-usable by the use of global variables. For instance, the admin section of a course can be made course-independent (and therefore re-usable) by using variables (actually token registers) courseAcronym and courseTitle instead of the text itself. The variables can then be set in the STEX preamble of the course notes file.  $\scalebox{setSGvar}(\scalebox{vname}) + (\scalebox{text}) + (\scalebox{to set the global variable} \scalebox{vname}) + (\scalebox{vname}) + (\s$ 

\setSGvar \useSGvar \ifSGvar

With \ifSGvar we can test for the contents of a global variable: the macro call

 $<sup>^{10}\</sup>mathrm{EdNote}$ : document LMID und LMXREf here if we decide to keep them.

 $\iffsGvar{\langle vname \rangle} {\langle val \rangle} {\langle ctext \rangle}$  tests the content of the global variable  $\langle vname \rangle$ , only if (after expansion) it is equal to  $\langle val \rangle$ , the conditional text  $\langle ctext \rangle$  is formatted.

#### 21.2.6 Colors

For convenience, the document-structure package defines a couple of color macros for the color package: For instance \blue abbreviates \textcolor{blue}, so that \red \blue{\something}} writes \setminus \convention something in blue. The macros \red \green, \cyan, \... \magenta, \brown, \yellow, \orange, \gray, and finally \black are analogous.

#### 21.3 Limitations

In this section we document known limitations. If you want to help alleviate them, please feel free to contact the package author. Some of them are currently discussed in the  $ST_EX$  GitHub repository [sTeX].

1. when option book which uses \pagestyle{headings} is given and semantic macros are given in the omgroup titles, then they sometimes are not defined by the time the heading is formatted. Need to look into how the headings are made.

# NotesSlides – Slides and Course Notes

We present a document class from which we can generate both course slides and course notes in a transparent way.

#### 22.1 Introduction

The notesslides document class is derived from beamer.cls [Tana], it adds a "notes version" for course notes derived from the omdoc class [Kohlhase:smomdl] that is more suited to printing than the one supplied by beamer.cls.

#### 22.2 The User Interface

The notesslides class takes the notion of a slide frame from Till Tantau's excellent beamer class and adapts its notion of frames for use in the STEXand OMDoc. To support semantic course notes, it extends the notion of mixing frames and explanatory text, but rather than treating the frames as images (or integrating their contents into the flowing text), the notesslides package displays the slides as such in the course notes to give students a visual anchor into the slide presentation in the course (and to distinguish the different writing styles in slides and course notes).

In practice we want to generate two documents from the same source: the slides for presentation in the lecture and the course notes as a narrative document for home study. To achieve this, the notesslides class has two modes: *slides mode* and *notes mode* which are determined by the package option.

#### 22.2.1 Package Options

The notesslides class takes a variety of class options: 11

slides notes

EdN:11

• The options slides and notes switch between slides mode and notes mode (see Section 22.2.2).

55

sectocframes

• If the option sectocframes is given, then for the omgroups, special frames with the omgroup title (and number) are generated.

showmeta

• showmeta. If this is set, then the metadata keys are shown (see [Koh20b] for details and customization options).

frameimages fiboxed

• If the option frameimages is set, then slide mode also shows the \frameimage-generated frames (see section 22.2.4). If also the fiboxed option is given, the slides are surrounded by a box.

topsect

• topsect= $\langle sect \rangle$  can be used to specify the top-level sectioning level; the default for  $\langle sect \rangle$  is section.

#### 22.2.2 Notes and Slides

frame note

Slides are represented with the frame just like in the beamer class, see [Tanb] for details. The notesslides class adds the note environment for encapsulating the course note fragments.<sup>4</sup>

Note that it is essential to start and end the notes environment at the start of the line – in particular, there may not be leading blanks – else LATEX becomes confused and throws error messages that are difficult to decipher.

```
\ifnotes\maketitle\else
\frame[noframenumbering]\maketitle\fi

\begin{note}
  We start this course with ...
\end{note}

\begin{frame}
  \frametitle{The first slide}
  ...
\end{frame}
\begin{note}
  ... and more explanatory text
\end{note}

\begin{frame}
  \frametitle{The second slide}
  ...
\end{frame}
```

Example 4: A typical Course Notes File

By interleaving the frame and note environments, we can build course notes as shown in Figure 4.

\ifnotes

Note the use of the \ifnotes conditional, which allows different treatment between

 $<sup>^{11}{</sup>m EdNote}$ : leaving out noproblems for the moment until we decide what to do with it.

<sup>&</sup>lt;sup>4</sup>MK: it would be very nice, if we did not need this environment, and this should be possible in principle, but not without intensive LaTeX trickery. Hints to the author are welcome.

notes and slides mode – manually setting \notestrue or \notesfalse is strongly discouraged however.

A: We need to give the title frame the **noframenumbering** option so that the frame numbering is kept in sync between the slides and the course notes.

A: The beamer class recommends not to use the allowframebreaks option on frames (even though it is very convenient). This holds even more in the notesslides case: At least in conjunction with \newpage, frame numbering behaves funnily (we have tried to fix this, but who knows).

\inputref\*

If we want to transclude a the contents of a file as a note, we can use a new variant \inputref\* of the \inputref macro from [KGA20]: \inputref\*{foo} is equivalent to \begin{note}\inputref{foo}\end{note}.

nparagraph

nfragment ndefinition nexample nsproof

nassertion

There are some environments that tend to occur at the top-level of note environments. We make convenience versions of these: e.g. the nparagraph environment is just an sparagraph inside a note environment (but looks nicer in the source, since it avoids one level of source indenting). Similarly, we have the nomgroup, ndefinition, nexample, nsproof, and nassertion environments.

#### 22.2.3 Header and Footer Lines of the Slides

\setslidelogo

The default logo provided by the notesslides package is the STEX logo it can be customized using  $\setslidelogo\{\langle logo\ name\rangle\}$ .

The default footer line of the notesslides package mentions copyright and licensing.

\setsource

In the beamer class, \source stores the author's name as the copyright holder. By default it is  $Michael\ Kohlhase$  in the notesslides package since he is the main user and designer of this package. \setsource{\langle name \rangle} can change the writer's name. For licensing, we use the Creative Commons Attribuition-ShareAlike license by default to strengthen the

\setlicensing

of this package. \setsource{\(\name\)\} can change the writer's name. For licensing, we use the Creative Commons Attribution-ShareAlike license by default to strengthen the public domain. If package hyperref is loaded, then we can attach a hyperlink to the license logo. \setlicensing[\(\lambda url\rangle)] \{\lambda go name\}\} is used for customization, where \(\lambda url\rangle\) is optional.

#### 22.2.4 Frame Images

\frameimage

Sometimes, we want to integrate slides as images after all – e.g. because we already have a PowerPoint presentation, to which we want to add STEXnotes. In this case we can use  $\frameimage[\langle opt\rangle] \{\langle path\rangle\}$ , where  $\langle opt\rangle$  are the options of  $\includegraphics$  from the graphicx package [CR99] and  $\langle path\rangle$  is the file path (extension can be left off like in  $\includegraphics$ ). We have added the label key that allows to give a frame label that can be referenced like a regular beamer frame.

\mhframeimage

The \mhframeimage macro is a variant of \frameimage with repository support. Instead of writing

\frameimage{\MathHub{fooMH/bar/source/baz/foobar}}

we can simply write (assuming that \MathHub is defined as above)

\mhframeimage[fooMH/bar]{baz/foobar}

EdN:12

 $<sup>^{12}{\</sup>rm EDNote}$ : MK: the hyperref link does not seem to work yet. I wonder why but do not have the time to fix it.

Note that the \mhframeimage form is more semantic, which allows more advanced document management features in MathHub.

If baz/foobar is the "current module", i.e. if we are on the MathHub path ...MathHub/fooMH/bar..., then stating the repository in the first optional argument is redundant, so we can just use

\mhframeimage{baz/foobar}

#### 22.2.5Colors and Highlighting

\textwarning

The \textwarning macro generates a warning sign:

#### 22.2.6Front Matter, Titles, etc.

#### 22.2.7Excursions

In course notes, we sometimes want to point to an "excursion" – material that is either presupposed or tangential to the course at the moment – e.g. in an appendix. The typical setup is the following:

```
\excursion{founif}{../ex/founif}{We will cover first-order unification in}
```

\begin{appendix}\printexcursions\end{appendix}

\excursion \activateexcursion The \excursion{ $\langle ref \rangle$ }{ $\langle path \rangle$ }{ $\langle text \rangle$ } is syntactic sugar for

```
\begin{nparagraph} [title=Excursion]
 \activateexcursion{founif}{../ex/founif}
 We will cover first-order unification in \sref{founif}.
\end{nparagraph}
```

\activateexcursion \printexcursions

where  $\activateexcursion{\langle path \rangle}$  augments the \printexcursions macro by a call \inputref{ $\langle path \rangle$ }. In this way, the 3\printexcursions macro (usually in the appendix) will collect up all excursions that are specified in the main text.

Sometimes, we want to reference – in an excursion – part of another. We can use \excursionref{ $\langle label \rangle$ } for that.

\excursionref

Finally, we usually want to put the excursions into an omgroup environment and add an introduction, therefore we provide the a variant of the \printexcursions macro: \excursiongroup[id= $\langle id \rangle$ ,intro= $\langle path \rangle$ ] is equivalent to

\excursiongroup

```
\begin{note}
\begin{sfragment}[id=<id>]{Excursions}
 \inputref{<path>}
  \printexcursions
\end{sfragment}
\end{note}
```

#### 22.2.8 Miscellaneous

#### 22.3 Limitations

In this section we document known limitations. If you want to help alleviate them, please feel free to contact the package author. Some of them are currently discussed in the STEXGitHub repository [sTeX].

1. when option book which uses \pagestyle{headings} is given and semantic macros are given in the omgroup titles, then they sometimes are not defined by the time the heading is formatted. Need to look into how the headings are made. This is a problem of the underlying omdoc package.

# problem.sty: An Infrastructure for formatting Problems

The problem package supplies an infrastructure that allows specify problems and to reuse them efficiently in multiple environments.

#### 23.1Introduction

The problem package supplies an infrastructure that allows specify problem. Problems are text fragments that come with auxiliary functions: hints, notes, and solutions<sup>5</sup>. Furthermore, we can specify how long the solution to a given problem is estimated to take and how many points will be awarded for a perfect solution.

Finally, the problem package facilitates the management of problems in small files, so that problems can be re-used in multiple environment.

#### 23.2The User Interface

#### 23.2.1Package Options

solutions notes hints gnotes pts min boxed

test

The problem package takes the options solutions (should solutions be output?), notes (should the problem notes be presented?), hints (do we give the hints?), gnotes (do we show grading notes?), pts (do we display the points awarded for solving the problem?), min (do we display the estimated minutes for problem soling). If theses are specified, then the corresponding auxiliary parts of the problems are output, otherwise, they remain

The boxed option specifies that problems should be formatted in framed boxes so that they are more visible in the text. Finally, the test option signifies that we are in a test situation, so this option does not show the solutions (of course), but leaves space for the students to solve them.

The mh option turns on MathHub support; see [Kohlhase:mss].

mh showmeta

Finally, if the showmeta is set, then the metadata keys are shown (see [Kohlhase:metakeys] for details and customization options).

<sup>&</sup>lt;sup>5</sup> for the moment multiple choice problems are not supported, but may well be in a future version

#### 23.2.2 Problems and Solutions

problem

min

title

The main environment provided by the problem package is (surprise surprise) the problem environment. It is used to mark up problems and exercises. The environment takes an optional KeyVal argument with the keys id as an identifier that can be reference later, pts for the points to be gained from this exercise in homework or quiz situations, min for the estimated minutes needed to solve the problem, and finally title for an informative title of the problem. For an example of a marked up problem see Figure 5 and the resulting markup see Figure 6.

```
\usepackage[solutions,hints,pts,min]{problem}
\begin{document}
  \begin{sproblem}[id=elefants,pts=10,min=2,title=Fitting Elefants]
   How many Elefants can you fit into a Volkswagen beetle?
\begin{hint}
 Think positively, this is simple!
\end{hint}
\begin{exnote}
 Justify your answer
\end{exnote}
\begin{solution}[for=elefants,height=3cm]
 Four, two in the front seats, and two in the back.
\begin{gnote}
 if they do not give the justification deduct 5 pts
\end{gnote}
\end{solution}
  \end{sproblem}
\end{document}
```

Example 5: A marked up Problem

solution solutions

id for height test The solution environment can be to specify a solution to a problem. If the solutions option is set or \solutionstrue is set in the text, then the solution will be presented in the output. The solution environment takes an optional KeyVal argument with the keys id for an identifier that can be reference for to specify which problem this is a solution for, and height that allows to specify the amount of space to be left in test situations (i.e. if the test option is set in the \usepackage statement).

```
Problem 0.1 (Fitting Elefants)
How many Elefants can you fit into a Volkswagen beetle?

Hint: Think positively, this is simple!

Note: Justify your answer

Solution: Four, two in the front seats, and two in the back.
```

Example 6: The Formatted Problem from Figure 5

hint exnote gnote

The hint and exnote environments can be used in a problem environment to give hints and to make notes that elaborate certain aspects of the problem.

The gnote (grading notes) environment can be used to document situations that

may arise in grading.

\startsolutions \stopsolutions

Sometimes we would like to locally override the solutions option we have given to the package. To turn on solutions we use the \startsolutions, to turn them off, \stopsolutions. These two can be used at any point in the documents.

Also, sometimes, we want content (e.g. in an exam with master solutions) conditional on whether solutions are shown. This can be done with the \ifsolutions conditional.

\ifsolutions

#### 23.2.3 Multiple Choice Blocks

mcb \mcc Multiple choice blocks can be formatted using the mcb environment, in which single choices are marked up with  $\mbox{mcc}[\langle keyvals \rangle] \{\langle text \rangle\}$  macro, which takes an optional key/value argument  $\langle keyvals \rangle$  for choice metadata and a required argument  $\langle text \rangle$  for the proposed answer text. The following keys are supported

T F Ttext Ftext feedback

- T for true answers, F for false ones,
- Ttext the verdict for true answers, Ftext for false ones, and
- feedback for a short feedback text given to the student.

See Figure ?? for an example

#### 23.2.4 Including Problems

\includeproblem

The \includeproblem macro can be used to include a problem from another file. It takes an optional KeyVal argument and a second argument which is a path to the file containing the problem (the macro assumes that there is only one problem in the include file). The keys title, min, and pts specify the problem title, the estimated minutes for solving the problem and the points to be gained, and their values (if given) overwrite the ones specified in the problem environment in the included file.

title min pts

#### 23.2.5 Reporting Metadata

The sum of the points and estimated minutes (that we specified in the pts and min keys to the problem environment or the \includeproblem macro) to the log file and the screen after each run. This is useful in preparing exams, where we want to make sure that the students can indeed solve the problems in an allotted time period.

The \min and \pts macros allow to specify (i.e. to print to the margin) the distribution of time and reward to parts of a problem, if the pts and pts package options are set. This allows to give students hints about the estimated time and the points to be awarded.

#### 23.3 Limitations

In this section we document known limitations. If you want to help alleviate them, please feel free to contact the package author. Some of them are currently discussed in the STEXGitHub repository [sTeX].

1. none reported yet

```
\begin{sproblem}[title=Functions]
        What is the keyword to introduce a function definition in python?
        \begin{mcb}

```

Example 7: A Problem with a multiple choice block

# hwexam.sty/cls: An Infrastructure for formatting Assignments and Exams

The hwexam package and class allows individual course assignment sheets and compound assignment documents using problem files marked up with the problem package.

#### Contents

#### 24.1 Introduction

The hwexam package and class supplies an infrastructure that allows to format nice-looking assignment sheets by simply including problems from problem files marked up with the problem package [Kohlhase:problem]. It is designed to be compatible with problems.sty, and inherits some of the functionality.

#### 24.2 The User Interface

#### 24.2.1 Package and Class Options

The hwexam package and class take the options solutions, notes, hints, gnotes, pts, min, and boxed that are just passed on to the problems package (cf. its documentation for a description of the intended behavior).

showmeta

If the **showmeta** option is set, then the metadata keys are shown (see [**Kohlhase:metakeys**] for details and customization options).

The hwexam class additionally accepts the options report, book, chapter, part, and showignores, of the omdoc package [Kohlhase:smomdl] on which it is based and passes them on to that. For the extrefs option see [Kohlhase:sref].

#### 24.2.2 Assignments

assignment number

title type given due This package supplies the assignment environment that groups problems into assignment sheets. It takes an optional KeyVal argument with the keys number (for the assignment number; if none is given, 1 is assumed as the default or — in multi-assignment documents — the ordinal of the assignment environment), title (for the assignment title; this is referenced in the title of the assignment sheet), type (for the assignment type; e.g. "quiz", or "homework"), given (for the date the assignment was given), and due (for the date the assignment is due).

#### 24.2.3 Typesetting Exams

multiple

Furthermore, the hwexam package takes the option multiple that allows to combine multiple assignment sheets into a compound document (the assignment sheets are treated as section, there is a table of contents, etc.).

test

Finally, there is the option test that modifies the behavior to facilitate formatting tests. Only in test mode, the macros \testspace, \testnewpage, and \testemptypage have an effect: they generate space for the students to solve the given problems. Thus they can be left in the LATEX source.

\testspace \testnewpage \testemptypage \testspace takes an argument that expands to a dimension, and leaves vertical space accordingly. \testnewpage makes a new page in test mode, and \testemptypage generates an empty page with the cautionary message that this page was intentionally left empty.

testheading duration min reqpts

Finally, the **\testheading** takes an optional keyword argument where the keys duration specifies a string that specifies the duration of the test, min specifies the equivalent in number of minutes, and reqpts the points that are required for a perfect grade.

#### 24.2.4 Including Assignments

\inputassignment

number title type given due The \inputassignment macro can be used to input an assignment from another file. It takes an optional KeyVal argument and a second argument which is a path to the file containing the problem (the macro assumes that there is only one assignment environment in the included file). The keys number, title, type, given, and due are just as for the assignment environment and (if given) overwrite the ones specified in the assignment environment in the included file.

#### 24.3 Limitations

In this section we document known limitations. If you want to help alleviate them, please feel free to contact the package author. Some of them are currently discussed in the STEXGitHub repository [sTeX].

1. none reported yet.

	\title{320101 General Computer Science (Fall 2010)}

```

\stex\_annotate:anw \stex\_annotate\_invisible:nn \stex\_annotate\_invisible:nnn We define four macros for introducing attributes in the HTML output. The definitions depend on the "backend" used (LATEXML, RusTeX, pdflatex).

The pdflatex-macros largely do nothing; the RusTEX-implementations are pretty clear in what they do, the LATEXML-implementations resort to perl bindings.

### 26.1 Generic Path Handling

We treat paths as LaTeX3-sequences (of the individual path segments, i.e. separated by a /-character) unix-style; i.e. a path is absolute if the sequence starts with an empty entry.

#### \stex\_path\_from\_string:Nn

```

                                                                    22.)
```

#### 26.3 File Hooks and Tracking

```
387 (@@=stex_files)
```

402 }

We introduce hooks for file inputs that keep track of the absolute paths of files used. This will be useful to keep track of modules, their archives, namespaces etc.

Note that the absolute paths are only accurate in \input-statements for paths relative to the PWD, so they shouldn't be relied upon in any other setting than for STEX-purposes.

```
\g__stex_files_stack
                          keeps track of file changes
                            >>> \seq_gclear_new:N\g_stex_files_stack

# The Implementation

### 34.1 Package Options

We declare some switches which will modify the behavior according to the package options. Generally, an option xxx will just set the appropriate switches to true (otherwise they stay false).<sup>13</sup>

```
4996 (*package)
4997 (@@=stex_sproof)
4998
4999 %%%%%%%%%%% sproof.dtx %%%%%%%%%%%%
```

### 34.2 Proofs

We first define some keys for the proof environment.

```
5001 \keys_define:nn { stex / spf } {
    id
           .str_set_x:N = \spfid,
5002
               .clist_set:N = \l__stex_sproof_spf_for_clist ,
    for
5003
               .tl_set:N
    from
                             = \l_stex_sproof_spf_from_tl
5004
                             = \l_stex_sproof_spf_proofend_tl,
    proofend
               .tl_set:N
5005
    type
                .str_set_x:N = \spftype,
5006
                .tl_set:N
                             = \spftitle,
     title
5007
               .tl_set:N
     continues
                             = \l_stex_sproof_spf_continues_tl,
                             = \l__stex_sproof_spf_functions_tl,
     functions
                .tl_set:N
    method
                .tl_set:N
                             = \l_stex_sproof_spf_method_tl
5010
5012 \cs_new_protected:Nn \__stex_sproof_spf_args:n {
5013 \str_clear:N \spfid
5014 \tl_clear:N \l__stex_sproof_spf_for_tl
5015 \tl_clear:N \l__stex_sproof_spf_from_tl
5017 \str_clear:N \spftype
5018 \tl_clear:N \spftitle
5019 \tl_clear:N \l__stex_sproof_spf_continues_tl
5020 \tl_clear:N \l__stex_sproof_spf_functions_tl
```

 $<sup>^{13}\</sup>mathrm{EdNote}\colon$  need an implementation for  $\mathrm{LaTeXML}$ 

```
5021 \tl_clear:N \l__stex_sproof_spf_method_tl
5022 \bool_set_false:N \l__stex_sproof_inc_counter_bool
5023 \keys_set:nn { stex / spf }{ #1 }
5024 }
```

\c\_stex\_sproof\_flow\_str

We define this macro, so that we can test whether the display key has the value flow 5025 \str\_set:Nn\c\_stex\_sproof\_flow\_str{inline}

```
(End definition for \c_stex_sproof_flow_str.)
```

For proofs, we will have to have deeply nested structures of enumerated list-like environments. However, LATEX only allows enumerate environments up to nesting depth 4 and general list environments up to listing depth 6. This is not enough for us. Therefore we have decided to go along the route proposed by Leslie Lamport to use a single top-level list with dotted sequences of numbers to identify the position in the proof tree. Unfortunately, we could not use his pf.sty package directly, since it does not do automatic numbering, and we have to add keyword arguments all over the place, to accommodate semantic information.

pst@with@label

This environment manages<sup>6</sup> the path labeling of the proof steps in the description environment of the outermost proof environment. The argument is the label prefix up to now; which we cache in \pst@label (we need evaluate it first, since are in the right place now!). Then we increment the proof depth which is stored in \cunt10 (lower counters are used by TEX for page numbering) and initialize the next level counter \cunt10 with 1. In the end call for this environment, we just decrease the proof depth counter by 1 again.

```
\intarray_new: Nn\l__stex_sproof_counter_intarray{50}
5026
   \cs_new_protected:Npn \sproofnumber {
5027

               The next two environments (proof steps) and comments, are mostly semantical, they
           take KeyVal arguments that specify their semantic role. In draft mode, they read these
           values and show them. If the surrounding proof had display=flow, then no new \item
          is generated, otherwise it is. In any case, the proof step number (at the current level) is
          incremented.

#### 34.3 Justifications

We define the actions that are undertaken, when the keys for justifications are encountered. Here this is very simple, we just define an internal macro with the value, so that we can use it later.

The next three environments and macros are purely semantic, so we ignore the keyval arguments for now and only display the content.  $^{16}$ 

 $<sup>^{16}\</sup>mathrm{EdNote}$  need to do something about the premise in draft mode.

```
justification

5530 \newenvironment{justification}[1][]{}{}

\premise

5531 \newcommand\stex_proof_premise:[2][]{#2}

(End definition for \premise. This function is documented on page ??.)

\justarg the \justarg macro is purely semantic, so we ignore the keyval arguments for now and only display the content.

5532 \newcommand\justarg[2][]{#2}

5533 \langle /package \rangle

(End definition for \justarg. This function is documented on page ??.)

Some auxiliary code, and clean up to be executed at the end of the package.

# document-structure.sty Implementation

#### 38.1 The document-structure Class

The functionality is spread over the document-structure class and package. The class provides the document environment and the document-structure element corresponds to it, whereas the package provides the concrete functionality.

```
5720 (*cls)
5721 (@@=document_structure)
5722 \ProvidesExplClass{document-structure}{2022/02/26}{3.0.1}{Modular Document Structure Class}
5723 \RequirePackage{13keys2e}
```

### 38.2 Class Options

\omdoc@cls@class

To initialize the document-structure class, we declare and process the necessary options using the kvoptions package for key/value options handling. For omdoc.cls this is quite simple. We have options report and book, which set the \omdoc@cls@class macro and pass on the macro to omdoc.sty for further processing.

```
\keys_define:nn{ document-structure / pkg }{
     class
                  .str_set_x:N = \c_document_structure_class_str,
     minimal
                  .bool_set:N
                                = \c_document_structure_minimal_bool,
5726
                                 = {
5727
       \ClassWarning{document-structure}{the option 'report' is deprecated, use 'class=report',
5728
       \str_set:Nn \c_document_structure_class_str {report}
5729
     },
5730
                  .code:n
5731
       \ClassWarning{document-structure}{the option 'book' is deprecated, use 'class=book', ins
5732
       \str_set:Nn \c_document_structure_class_str {book}
5733
5734
                  .code:n
5735
       \ClassWarning{document-structure}{the option 'bookpart' is deprecated, use 'class=book,t
       \str_set:Nn \c_document_structure_class_str {book}
5737
       \str_set:Nn \c_document_structure_topsect_str {chapter}
5738
     },
5739
```

```
.str_set_x:N = \c_document_structure_docopt_str,
                                 = {
                  .code:n
5741
     unknown
        \PassOptionsToPackage{ \CurrentOption }{ document-structure }
5742
5743
5744 }
    \ProcessKeysOptions{ document-structure / pkg }
5745
    \str_if_empty:NT \c_document_structure_class_str {
5746
     \str_set:Nn \c_document_structure_class_str {article}
5747
5748 }
   \exp_after:wN\LoadClass\exp_after:wN[\c_document_structure_docopt_str]
     {\c_document_structure_class_str}
5750
5751
```

### 38.3 Beefing up the document environment

Now, - unless the option minimal is defined - we include the stex package

```
5752 \RequirePackage{document-structure}
5753 \bool_if:NF \c_document_structure_minimal_bool {
```

And define the environments we need. The top-level one is the document environment, which we redefined so that we can provide keyval arguments.

document

For the moment we do not use them on the LATEX level, but the document identifier is picked up by LATEXML.<sup>17</sup>

```
'to keys_define:nn { document-structure / document } {
    id .str_set_x:N = \c_document_structure_document_id_str
    }

to let\__document_structure_orig_document=\document

to keys_set:nn{ document-structure / document } { #1 }

to keys_set:nn{ document-structure / document } { #1 }

to let keys_set:nn{ document-structure / document } { #1 }

to let keys_set:nn{ document-structure_document } { *1 }

to let keys_set:nn{ document-structure_document_id_str }

to let keys_set:nn{ document-structure_document } { *1 }

to let keys_set:nn{ document-structure_document } { *2 }

to let keys_set:nn{ document-structure_document_id_str }

to let keys_set:nn{ document-structure_document } { *3 }

to let keys_set:nn{ document-structure_document } { *4 }

to let keys_set:nn{ document_structure_document_structure_document_id_str }

to let keys_set:nn{ document-structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_structure_document_s
```

### 38.4 Implementation: document-structure Package

```
5765 (*package)
5766 \ProvidesExplPackage{document-structure}{2022/02/26}{3.0.1}{Modular Document Structure}
5767 \RequirePackage{13keys2e}
```

### 38.5 Package Options

We declare some switches which will modify the behavior according to the package options. Generally, an option xxx will just set the appropriate switches to true (otherwise they stay false).

EdN:17

 $<sup>^{17}\</sup>mathrm{EdNote};\ \mathsf{faking}\ \mathsf{documentkeys}\ \mathsf{for}\ \mathsf{now}.$  @HANG, please implement

```
\keys_define:nn{ document-structure / pkg }{
5769
                  .str_set_x:N = \c_document_structure_class_str,
5770
                  .str_set_x:N = \c_document_structure_topsect_str,
     topsect
5771
      showignores .bool_set:N
                                = \c_document_structure_showignores_bool,
5772
5773
   \ProcessKeysOptions{ document-structure / pkg }
   \str_if_empty:NT \c_document_structure_class_str {
     \str_set:Nn \c_document_structure_class_str {article}
5777
   \str_if_empty:NT \c_document_structure_topsect_str {
     \str_set:Nn \c_document_structure_topsect_str {section}
5779
5780 }
```

Then we need to set up the packages by requiring the **sref** package to be loaded, and set up triggers for other languages

```
\RequirePackage{xspace}
\RequirePackage{comment}

\AddToHook{begindocument}{

\text{tx@ifpackageloaded{babel}}{

\text{clist_set:Nx \l_tmpa_clist {\bbl@loaded}}

\text{clist_if_in:NnT \l_tmpa_clist {\ngerman}{

\makeatletter\input{document-structure-ngerman.ldf}\makeatother

\text{rss}

}

\text{sys}

}

\text{}

\text{sys}

\text{sys}
```

\section@level

Finally, we set the \section@level macro that governs sectioning. The default is two (corresponding to the article class), then we set the defaults for the standard classes book and report and then we take care of the levels passed in via the topsect option.

```
\int_new:N \l_document_structure_section_level_int
   \str_case:VnF \c_document_structure_topsect_str {
     {part}{
        \int_set:Nn \l_document_structure_section_level_int {0}
5795
     {chapter}{
5796
        \int_set:Nn \l_document_structure_section_level_int {1}
5797
     }
5798
5799 }{
      \str_case:VnF \c_document_structure_class_str {
5800
5801
          \int_set:Nn \l_document_structure_section_level_int {0}
5802
       }
        {report}{
          \int_set:Nn \l_document_structure_section_level_int {0}
5805
       }
5806
     ትና
5807
        \int_set:Nn \l_document_structure_section_level_int {2}
5808
     }
5809
5810 }
```

#### 38.6 Document Structure

The structure of the document is given by the omgroup environment just like in OMDoc. The hierarchy is adjusted automatically according to the LATEX class in effect.

\currentsectionlevel

EdN:18

For the \currentsectionlevel and \Currentsectionlevel macros we use an internal macro \current@section@level that only contains the keyword (no markup). We initialize it with "document" as a default. In the generated OMDoc, we only generate a text element of class omdoc\_currentsectionlevel, wich will be instantiated by CSS later. 18

```
5811 \def\current@section@level{document}%
5812 \newcommand\currentsectionlevel{\lowercase\expandafter{\current@section@level}\xspace}%
5813 \newcommand\Currentsectionlevel{\expandafter\MakeUppercase\current@section@level\xspace}%
```

(End definition for \currentsectionlevel. This function is documented on page ??.)

```
\skipomgroup
```

```
5814 \cs_new_protected:Npn \skipomgroup {
      \ifcase\l_document_structure_section_level_int
5815
      \or\stepcounter{part}
5816
      \or\stepcounter{chapter}
5817
      \or\stepcounter{section}
5818
      \or\stepcounter{subsection}
5819
      \or\stepcounter{subsubsection}
5820
      \or\stepcounter{paragraph}
5821
      \or\stepcounter{subparagraph}
5822
5823
      \fi
5824 }
```

#### blindfragment

```
\newcommand\at@begin@blindomgroup[1]{}

\newenvironment{blindfragment}

\text{
\int_incr:N\l_document_structure_section_level_int}

\at@begin@blindomgroup\l_document_structure_section_level_int}

\text{\figstar \text{\fightar \text{\figstar \text{\figstar \text{\fightar \fightar \text{\fightar \text{\fightar \fightar \text{\fightar \text{\fightar \text{\fightar \text{\fightar \text{\fightar \text{\fightar \text{\fightar \text{\fightar \text{\fightar \text{\fin} \text{\fightar \text{\fin} \text{\fightar \text{\fin} \text{\fightar \text{\fightar \text{\fin} \text{\fightar \text{\fin} \text{\fightar \text{\fightar \text{\fin} \text{\fin} \te
```

\omgroup@nonum

convenience macro:  $\operatorname{\mathsf{Nomgroup@nonum}}\{\langle level\rangle\}\{\langle title\rangle\}$  makes an unnumbered sectioning with title  $\langle title\rangle$  at level  $\langle level\rangle$ .

```
\newcommand\omgroup@nonum[2]{

5832 \ifx\hyper@anchor\@undefined\else\phantomsection\fi

5833 \addcontentsline{toc}{#1}{#2}\@nameuse{#1}*{#2}

5834 }
```

(End definition for \omgroup@nonum. This function is documented on page ??.)

\omgroup@num

convenience macro:  $\operatorname{omgroup@nonum}\{\langle level\rangle\}\{\langle title\rangle\}$  makes numbered sectioning with title  $\langle title\rangle$  at level  $\langle level\rangle$ . We have to check the short key was given in the omgroup environment and – if it is use it. But how to do that depends on whether the rdfmeta package has been loaded. In the end we call  $\operatorname{sref@label@id}$  to enable crossreferencing.

5835 \newcommand\omgroup@num[2]{

 $<sup>^{18}\</sup>mathrm{EdNote}$ : MK: we may have to experiment with the more powerful uppercasing macro from <code>mfirstuc.sty</code> once we internationalize.

```

             \tl_clear:N \l__document_structure_omgroup_srccite_tl
             \tl_clear:N \l__document_structure_omgroup_type_tl
            \tl_clear:N \l__document_structure_omgroup_short_tl
 5866
            \tl_clear:N \l__document_structure_omgroup_display_tl
 5867
            \tl_clear:N \l__document_structure_omgroup_intro_tl
 5868
            \bool_set_false: N \l__document_structure_omgroup_loadmodules_bool
 5869
             \keys_set:nn { document-structure / omgroup } { #1 }
 5870
```

\at@begin@omgroup

5871 }

sfragment

we define a switch for numbering lines and a hook for the beginning of groups: The \at@begin@omgroup macro allows customization. It is run at the beginning of the omgroup, i.e. after the section heading.

```
\newif\if@mainmatter\@mainmattertrue
newcommand\at@begin@omgroup[3][]{}
```

Then we define a helper macro that takes care of the sectioning magic. It comes with its own key/value interface for customization.

```
5874 \keys_define:nn { document-structure / sectioning }{
              .str_set_x:N = \l__document_structure_sect_name_str
5875
     name
              . \verb| str_set_x: \verb| N = \label{eq:structure_sect_ref_str} |
     ref
5876
              .bool_set:N
                              = \l__document_structure_sect_clear_bool ,
     clear
5877
              .default:n
                              = {true}
     clear
5878
     num
              .bool set:N
                             = \l__document_structure_sect_num_bool
5879
```

```
5881 }
    \cs_new_protected:Nn \__document_structure_sect_args:n {
5882
      \str_clear:N \l__document_structure_sect_name_str
5883
      \str_clear:N \l__document_structure_sect_ref_str
5884
      \bool_set_false:N \l__document_structure_sect_clear_bool
5885
      \bool_set_false:N \l__document_structure_sect_num_bool
5886
      \keys_set:nn { document-structure / sectioning } { #1 }
5887
    \newcommand\omdoc@sectioning[3][]{
5889
      \__document_structure_sect_args:n {#1 }
      \let\omdoc@sect@name\l__document_structure_sect_name_str

5916 %\fi
5917 }% hypreref.sty loaded?
now the omgroup environment itself. This takes care of the table of contents via the helper
macro above and then selects the appropriate sectioning command from article.cls.
It also registeres the current level of omgroups in the \omgroup@level counter.
   \newenvironment{sfragment}[2][]% keys, title
5919 {
      \__document_structure_omgroup_args:n { #1 }%\sref@target%
```

.default:n

nıım

table of contents.

5921

5922

5923

5880

= {true}

If the loadmodules key is set on \begin{sfragment}, we redefine the \addcontetsline macro that determines how the sectioning commands below construct the entries for the

\bool\_if:NT \l\_\_document\_structure\_omgroup\_loadmodules\_bool {

\omgroup@redefine@addtocontents{

%\@ifundefined{module@id}\used@modules%

```
%{\@ifundefined{module@\module@id @path}{\used@modules}\module@id}
5924
        }
5925
      }
5926
now we only need to construct the right sectioning depending on the value of \section@level.
      \int_incr:N\l_document_structure_section_level_int
      \ifcase\l_document_structure_section_level_int
        \or\omdoc@sectioning[name=\omdoc@part@kw,clear,num]{part}{#2}

      \at@begin@omgroup[#1]\l_document_structure_section_level_int{#2}
5937
      \str_if_empty:NF \l__document_structure_omgroup_id_str {
5938
        \stex_ref_new_doc_target:n\l__document_structure_omgroup_id_str
5939
5940
5941 }% for customization
   {}
5942
    and finally, we localize the sections
    \newcommand\omdoc@part@kw{Part}
    \newcommand\omdoc@chapter@kw{Chapter}
    \newcommand\omdoc@section@kw{Section}
    \newcommand\omdoc@subsection@kw{Subsection}
    \newcommand\omdoc@subsubsection@kw{Subsubsection}
    \newcommand\omdoc@paragraph@kw{paragraph}
    \newcommand\omdoc@subparagraph@kw{subparagraph}
```

#### 38.7 Front and Backmatter

Index markup is provided by the omtext package [Koh20c], so in the document-structure package we only need to supply the corresponding \printindex command, if it is not already defined

\printindex

```
\text{\jobname.ind}{\}}\
\(End definition for \printindex. This function is documented on page ??.\)
\text{some classes (e.g. book.cls) already have \frontmatter, \mainmatter, and \backmatter macros. As we want to define frontmatter and backmatter environments, we save their behavior (possibly defining it) in orig@*matter macros and make them undefined (so that we can define the environments).

\[
\sum_{5951} \cs_if_exist:\text{NTF\frontmatter}{\} \]
\[
\sum_{5952} \let__document structure_orig_frontmatter\frontmatter}
\]
```

```
}
5959
5960 }
   \cs_if_exist:NTF\backmatter{
5961
      \let\__document_structure_orig_backmatter\backmatter
5962
      \let\backmatter\relax
5963
5964
      \tl_set:Nn\__document_structure_orig_backmatter{
5965
        \clearpage
5966
        \@mainmatterfalse
        \pagenumbering{roman}
     }
5969
5970 }
```

Using these, we can now define the frontmatter and backmatter environments

frontmatter we use the \orig@frontmatter macro defined above and \mainmatter if it exists, otherwise we define it.

```
\newenvironment{frontmatter}{
      \__document_structure_orig_frontmatter
5972
5973 }{
      \cs_if_exist:NTF\mainmatter{
5974
        \mainmatter
5975
5976
5977
        \clearpage
        \@mainmattertrue
        \pagenumbering{arabic}
5979
5980
5981 }
```

backmatter As backmatter is at the end of the document, we do nothing for \endbackmatter.

```
5982 \newenvironment{backmatter}{
5983    \__document_structure_orig_backmatter
5984 }{
5985    \cs_if_exist:NTF\mainmatter{
5986    \mainmatter
5987 }{
5988    \clearpage
5989    \@mainmattertrue
5990    \pagenumbering{arabic}
5991 }
5992 }
```

finally, we make sure that page numbering is a rabic and we have main matter as the default

5993 \@mainmattertrue\pagenumbering{arabic}

\prematurestop

We initialize \afterprematurestop, and provide \prematurestop@endomgroup which looks up \omgroup@level and recursively ends enough {sfragment}s.

```
5994 \def \c__document_structure_document_str{document}
5995 \newcommand\afterprematurestop{}
5996 \def\prematurestop@endomgroup{
5997 \unless\ifx\@currenvir\c__document_structure_document_str
5998 \expandafter\expandafter\expandafter\expandafter\expandafter\expandafter
5999 \expandafter\prematurestop@endomgroup
```

```
6000 \fi
6001 }
6001 }
6002 \providecommand\prematurestop{
6003 \message{Stopping~sTeX~processing~prematurely}
6004 \prematurestop@endomgroup
6005 \afterprematurestop
6006 \end{document}
6007 }
(End definition for \prematurestop. This function is documented on page ??.)
```

#### 38.8 Global Variables

```
\setSGvar set a global variable
            6008 \RequirePackage{etoolbox}
            ^newcommand\setSGvar[1]{\@namedef{sTeX@Gvar@#1}}
            (End definition for \setSGvar. This function is documented on page ??.)
\useSGvar use a global variable
            6010 \newrobustcmd\useSGvar[1]{%
                  \@ifundefined{sTeX@Gvar@#1}
                  {\PackageError{document-structure}
            6012
                    {The sTeX Global variable #1 is undefined}
            6013
                    {set it with \protect\setSGvar}}
            6014
            6015 \@nameuse{sTeX@Gvar@#1}}
            (End definition for \useSGvar. This function is documented on page ??.)
 \ifSGvar execute something conditionally based on the state of the global variable.
                \newrobustcmd\ifSGvar[3]{\def\@test{#2}%
            6016
                  \@ifundefined{sTeX@Gvar@#1}
            6017
                  {\PackageError{document-structure}
            6018
                    {The sTeX Global variable #1 is undefined}
            6019
                    {set it with \protect\setSGvar}}
            6020
                  {\expandafter\ifx\csname sTeX@Gvar@#1\endcsname\@test #3\fi}}
            (End definition for \ifSGvar. This function is documented on page ??.)
```

# NotesSlides – Implementation

### 39.1 Class and Package Options

We define some Package Options and switches for the notesslides class and activate them by passing them on to beamer.cls and omdoc.cls and the notesslides package. We pass the nontheorem option to the statements package when we are not in notes mode, since the beamer package has its own (overlay-aware) theorem environments.

```
6022 (*cls)
6023 (@@=notesslides)
\label{lem:condition} $$ $$ \Pr \text{ovidesExplClass}\{notesslides} \\ \{2022/02/28\} \\ \{3.1.0\}\{notesslides \ Class\} \\ \{3.1.0\} \\ \{notesslides \ Class\} \\ \{3.1.0\} \\ \{notesslides \ Class\} \\ \{notesslides \ Class \ Class \ Class \ Class \ Class \ Class \\ \{notesslides \ Class \ Class \ Class \ Class \ Class \\ \{notesslides \ Class \ Class \ Class \ Class \ Class \ Class \\ \{notesslides \ Class \\ \{notesslides \ Class \\ \{notesslides \ Class \ 
          \RequirePackage{13keys2e}
6026
           \keys_define:nn{notesslides / cls}{
6027
                                         .code:n = {
6028
                         \PassOptionsToClass{\CurrentOption}{document-structure}
6029
                         \str_if_eq:nnT{#1}{book}{
6030
                                 \PassOptionsToPackage{defaulttopsec=part}{notesslides}
                         \str_if_eq:nnT{#1}{report}{
                                \PassOptionsToPackage{defaulttopsec=part}{notesslides}
6034
6035
                 },
6036
                                            .bool_set:N = \c_notesslides_notes_bool,
                 notes
6037
                                                                                         = { \bool_set_false: N \ c_notesslides_notes_bool },
                 slides .code:n
6038
                  unknown .code:n
6039
                         \PassOptionsToClass{\CurrentOption}{document-structure}
                         \PassOptionsToClass{\CurrentOption}{beamer}
                         \PassOptionsToPackage{\CurrentOption}{notesslides}
6043
6044 }
6045 \ProcessKeysOptions{ notesslides / cls }
6046 \bool_if:NTF \c__notesslides_notes_bool {
                  \PassOptionsToPackage{notes=true}{notesslides}
6047
6048 }{
                  \PassOptionsToPackage{notes=false}{notesslides}
6049
6050 }
6051 (/cls)
```

```
now we do the same for the notesslides package.
   (*package)
    \ProvidesExplPackage{notesslides}{2022/02/28}{3.1.0}{notesslides Package}
    \RequirePackage{13keys2e}
6054
6055
    \keys_define:nn{notesslides / pkg}{
6056
      topsect
                      .str_set_x:N = \c__notesslides_topsect_str,
6057
      defaulttopsect .str_set_x:N = \c__notesslides_defaulttopsec_str,
6058
      notes
                      .bool_set:N
                                    = \c_notesslides_notes_bool ,
                                    = { \bool_set_false: N \ c_notesslides_notes_bool },
      slides
                      .code:n
                      .bool_set:N
                                    = \c__notesslides_sectocframes_bool ,
      sectocframes
                      .bool_set:N
                                    = \c_notesslides_frameimages_bool ,
      frameimages
                      .bool_set:N
                                    = \c_notesslides_fiboxed_bool ,
      fiboxed
                      .bool set:N
                                    = \c_notesslides_noproblems_bool,
      noproblems
6064
      unknown
                      .code:n
6065
        \PassOptionsToClass{\CurrentOption}{stex}
6066
        \PassOptionsToClass{\CurrentOption}{tikzinput}
6067
6068
    \ProcessKeysOptions{ notesslides / pkg }
   \newif\ifnotes
6072 \bool_if:NTF \c__notesslides_notes_bool {
6073
      \notestrue
6074 }{
      \notesfalse
6075
6076 }
we give ourselves a macro \@dtopsect that needs only be evaluated once, so that the
\ifdefstring conditionals work below.
6078 \str_if_empty:NTF \c__notesslides_topsect_str {
      6080 75
      \verb|\str_set_eq:NN \ | \_notesslidestopsect \ | \ | c\_notesslides\_topsect\_str|
6081
6082 }
6083 (/package)
    Depending on the options, we either load the article-based document-structure
or the beamer class (and set some counters).
    \bool_if:NTF \c__notesslides_notes_bool {
      \LoadClass{document-structure}
6087 74
      \LoadClass[10pt,notheorems,xcolor={dvipsnames,svgnames}]{beamer}
6088
      \newcounter{Item}
6089
      \newcounter{paragraph}
6090
      \newcounter{subparagraph}
6091
      \newcounter{Hfootnote}
      \RequirePackage{document-structure}
```

now it only remains to load the notesslides package that does all the rest.

6095 \RequirePackage{notesslides}

6096 (/cls)

In notes mode, we also have to make the beamer-specific things available to article via the beamerarticle package. We use options to avoid loading theorem-like environments, since we want to use our own from the STEX packages. The first batch of packages we want are loaded on notesslides.sty. These are the general ones, we will load the STEX-specific ones after we have done some work (e.g. defined the counters m\*). Only the stex-logo package is already needed now for the default theme.

```
⟨*package⟩
6097
   \bool_if:NT \c_notesslides_notes_bool {}
6098
     \RequirePackage{a4wide}
6099
      \RequirePackage{marginnote}
6100
      \PassOptionsToPackage{usenames, dvipsnames, svgnames}{xcolor}
6101
      \RequirePackage{mdframed}
6102
     \RequirePackage[noxcolor,noamsthm]{beamerarticle}
6103
      RequirePackage[bookmarks,bookmarksopen,bookmarksnumbered,breaklinks,hidelinks]{hyperref}
6104
6105 }
   \RequirePackage{stex-tikzinput}
   \RequirePackage{etoolbox}
   \RequirePackage{amssymb}
   \RequirePackage{amsmath}
   \RequirePackage{comment}
6111 \RequirePackage{textcomp}
6112 \RequirePackage{url}
6113 \RequirePackage{graphicx}
6114 \RequirePackage{pgf}
```

#### 39.2 Notes and Slides

For the lecture notes cases, we also provide the \usetheme macro that would otherwise come from the the beamer class. While the latter loads beamertheme $\langle theme \rangle$ .sty, the notes version loads beamernotestheme $\langle theme \rangle$ .sty. 19

```
\bool_if:NT \c__notesslides_notes_bool {
      \renewcommand\usetheme[2][]{\usepackage[#1]{beamernotestheme#2}}
6117 }
6118
6119
   \NewDocumentCommand \libusetheme {O{} m} {
6120
     \bool_if:NTF \c__notesslides_notes_bool {
6121
        \libusepackage[#1]{beamernotestheme#2}
6122
6123
      \libusepackage[#1]{beamertheme#2}
6124
6125
6126 }
```

We define the sizes of slides in the notes. Somehow, we cannot get by with the same here.

```
6127 \newcounter{slide}
6128 \newlength{\slidewidth}\setlength{\slidewidth}{13.5cm}
6129 \newlength{\slideheight}\setlength{\slideheight}{9cm}
```

EdN:19

 $<sup>\</sup>overline{\ \ ^{19}{
m EdNote:}\ \ {
m MK:}\ \ {
m This}\ \ {

#### 39.3 Header and Footer Lines

Now, we set up the infrastructure for the footer line of the slides, we use boxes for the logos, so that they are only loaded once, that considerably speeds up processing.

\setslidelogo

The default logo is the SIEX logo. Customization can be done by  $\setslidelogo\{\langle logo name \rangle\}$ .

```
6254 \newlength{\slidelogoheight}
6255
6256 \bool_if:NTF \c__notesslides_notes_bool {
6257  \setlength{\slidelogoheight}{.4cm}
6258 }{
6259  \setlength{\slidelogoheight}{1cm}
6260 }
6261 \newsavebox{\slidelogo}
6262 \sbox{\slidelogo}{\stext{\slidelogo}}{\stext{\slidelogo}}{1]{
6263  \newrobustcmd{\setslidelogo}{\includegraphics[height=\slidelogoheight]{#1}}
6264  \sbox{\slidelogo}{\includegraphics[height=\slidelogoheight]{#1}}
6265 }
```

(End definition for \setslidelogo. This function is documented on page ??.)

\setsource

\source stores the writer's name. By default it is *Michael Kohlhase* since he is the main user and designer of this package. \setsource $\{\langle name \rangle\}$  can change the writer's name.

```
\label{locally bound} $$ $$ \end{\colored} $$
```

 $(\textit{End definition for } \verb|\scale= This function is documented on page \ref{eq:constraint})$ 

\setlicensing

Now, we set up the copyright and licensing. By default we use the Creative Commons Attribuition-ShareAlike license to strengthen the public domain. If package hyperref is loaded, then we can attach a hyperlink to the license logo.  $\ensuremath{\mbox{setlicensing}}[\langle url \rangle] \{\langle logoname \rangle\}$  is used for customization, where  $\langle url \rangle$  is optional.

```
6268 \def\copyrightnotice{\footnotesize\copyright :\hspace{.3ex}{\source}}

# 39.5 Colors and Highlighting

We first specify sans serif fonts as the default.

```
6347 \sffamily
```

Now, we set up an infrastructure for highlighting phrases in slides. Note that we use content-oriented macros for highlighting rather than directly using color markup. The first thing to to is to adapt the green so that it is dark enough for most beamers

```
6348 \AddToHook{begindocument}{
6349 \definecolor{green}{rgb}{0,.5,0}
6350 \definecolor{purple}{cmyk}{.3,1,0,.17}
6351 }
```

We customize the \defemph, \symrefemph, \compemph, and \titleemph macros with colors. Furthermore we customize the \\_\_omtextlec macro for the appearance of line end comments in \lec.

```
6352 % \def\STpresent#1{\textcolor{blue}{#1}}
6353 \def\defemph#1{{\textcolor{magenta}{#1}}}
6354 \def\symrefemph#1{{\textcolor{cyan}{#1}}}

      \begin{picture}(0,0)\put(#1){#2}\end{picture}
6378 }
```

## 39.6 Sectioning

If the sectocframes option is set, then we make section frames. We first define counters for part and chapter, which beamer.cls does not have and we make the section counter which it does dependent on chapter.

```
6379 \bool_if:NT \c__notesslides_sectocframes_bool {
6380 \str_if_eq:VnTF \__notesslidestopsect{part}{
6381 \newcounter{chapter}\counterwithin*{section}{chapter}
6382 }{
6383 \str_if_eq:VnT\__notesslidestopsect{chapter}{
6384 \newcounter{chapter}\counterwithin*{section}{chapter}
6385 }
6386 }
6387 }
```

\section@level

We set the \section@level counter that governs sectioning according to the class options. We also introduce the sectioning counters accordingly.

\section@level

```
\def\part@prefix{\arabic{chapter}.}
6394
        }
6395
        {chapter}{
6396
           \int_set:Nn \l_document_structure_section_level_int {1}
6397
           \def\thesection{\arabic{chapter}.\arabic{section}}
6398
           \def\part@prefix{\arabic{chapter}.}
6399
6400
      }{
6401
         \int_set:Nn \l_document_structure_section_level_int {2}
        \def\part@prefix{}
6403
6404
6405
6406
    \bool_if:NF \c__notesslides_notes_bool { % only in slides
(End definition for \section@level. This function is documented on page ??.)
```

The new counters are used in the omgroup environment that choses the LATEX sectioning macros according to \section@level.

#### sfragment

#### 39.7 Excursions

\gdef\printexcursions{}

\excursion

The excursion macros are very simple, we define a new internal macro \excursionref and use it in \excursion, which is just an \inputref that checks if the new macro is defined before formatting the file in the argument.

```
\newcommand\excursionref[2]{% label, text
                         \bool_if:NT \c__notesslides_notes_bool {
                   6491
                           \begin{sparagraph}[title=Excursion]
                   6492
                             #2 \operatorname{f[fallback=the\ appendix]{#1}}.
                   6493
                           \end{sparagraph}
                   6494
                   6495
                   6496 }
                   6497
                       \newcommand\activate@excursion[2][]{
                         \gappto\printexcursions{\inputref[#1]{#2}}
                   6498
                       \newcommand\excursion[4][]{% repos, label, path, text
                         \bool_if:NT \c__notesslides_notes_bool {
                           \activate@excursion[#1]{#3}\excursionref{#2}{#4}
                   6502
                   6503
                   6504 }
                  (End definition for \excursion. This function is documented on page ??.)

```

(End definition for \excursiongroup. This function is documented on page ??.)

# Chapter 40

# The Implementation

## 40.1 Package Options

The first step is to declare (a few) package options that handle whether certain information is printed or not. They all come with their own conditionals that are set by the options.

```
6532 (*package)
6533 (00=problems)
6534 \ProvidesExplPackage{problem}{2022/02/26}{3.0.1}{Semantic Markup for Problems}
   \RequirePackage{13keys2e,stex}
6535
6536
6537 \keys_define:nn { problem / pkg }{
    notes .default:n
                          = { true },
6538
              .bool_set:N = \c__problems_notes_bool,
    notes
                            = { true },
     gnotes
              .default:n
     gnotes .bool_set:N = \c__problems_gnotes_bool,
    hints
              .default:n
                            = { true },
6542
            .bool_set:N = \c__problems_hints_bool,
    hints
6543
    solutions .default:n
                            = { true },
6544
    solutions .bool_set:N = \c_problems_solutions_bool,
6545
            .default:n
                             = { true },
6546
             .bool_set:N = \c_problems_pts_bool,
    pts
6547
             .default:n
                             = { true },
6548
             .bool\_set:N = \c_\_problems\_min\_bool,
     boxed .default:n
                             = { true },
     boxed .bool_set:N = \c_problems_boxed_bool,
     unknown .code:n
6552
6553 }
   \newif\ifsolutions
6554
6555
6556 \ProcessKeysOptions{ problem / pkg }
   \bool_if:NTF \c__problems_solutions_bool {
     \solutionstrue
6559 }{
     \solutionsfalse
```

Then we make sure that the necessary packages are loaded (in the right versions).

```
6562 \RequirePackage{comment}
```

The next package relies on the IATEX3 kernel, which LATEXMLonly partially supports. As it is purely presentational, we only load it when the boxed option is given and we run LATEXML.

```
6563 \bool_if:NT \c__problems_boxed_bool { \RequirePackage{mdframed} }
```

\prob@\*@kw For multilinguality, we define internal macros for keywords that can be specialized in \*.ldf files.

```
6564 \def\prob@problem@kw{Problem}
    \def\prob@solution@kw{Solution}
    \def\prob@hint@kw{Hint}
6567 \def\prob@note@kw{Note}
6568 \def\prob@gnote@kw{Grading}
6569 \def\prob@pt@kw{pt}
6570 \def\prob@min@kw{min}
(End definition for \prob@*@kw. This function is documented on page ??.)
    For the other languages, we set up triggers
    \AddToHook{begindocument}{
      \ltx@ifpackageloaded{babel}{
           \makeatletter
6573
           \clist_set:Nx \l_tmpa_clist {\bbl@loaded}
6575
           \clist_if_in:NnT \l_tmpa_clist {ngerman}{
             \input{problem-ngerman.ldf}
6576
6577
           \clist_if_in:NnT \l_tmpa_clist {finnish}{
6578
             \input{problem-finnish.ldf}
6579
6580
           \clist_if_in:NnT \l_tmpa_clist {french}{
6581
             \input{problem-french.ldf}
6582
           \clist_if_in:NnT \l_tmpa_clist {russian}{
             \input{problem-russian.ldf}
6585
6586
           \makeatother
6587
      }{}
6588
6589 }
```

#### 40.2 Problems and Solutions

We now prepare the KeyVal support for problems. The key macros just set appropriate internal macros.

```
\keys_define:nn{ problem / problem }{
              .str_set_x:N = \l_problems_prob_id_str,
     id
6592
     pts
              .tl_set:N
                            = \l__problems_prob_pts_tl,
              .tl_set:N
                            = \l__problems_prob_min_tl,
6593
     min
                            = \1_problems_prob_title_tl,
              .tl_set:N
6594
     title
              .tl set:N
                            = \l__problems_prob_type_tl,
6595
     type
             .int_set:N
                            = \l__problems_prob_refnum_int
     refnum
6596
6598 \cs_new_protected:Nn \__problems_prob_args:n {
```

```
\str_clear:N \l__problems_prob_id_str
6599
     \tl_clear:N \l__problems_prob_pts_tl
6600
     \tl_clear:N \l__problems_prob_min_tl
6601
     \tl_clear:N \l__problems_prob_title_tl
6602
     \tl_clear:N \l__problems_prob_type_tl
6603
     \int_zero_new:N \l__problems_prob_refnum_int
6604
     \keys_set:nn { problem / problem }{ #1 }
6605
     \int_compare:nNnT \l__problems_prob_refnum_int = 0 {
       \label{lems_prob_refnum_int} \
6608
6609
```

Then we set up a counter for problems.

#### \numberproblemsin

```
6610 \newcounter{problem}
6611 \newcommand\numberproblemsin[1]{\@addtoreset{problem}{#1}}
(End definition for \numberproblemsin. This function is documented on page ??.)
```

\prob@label We provide the macro \prob@label to redefine later to get context involved.

6612 \newcommand\prob@label[1]{#1}

(End definition for \prob@label. This function is documented on page ??.)

\prob@number

We consolidate the problem number into a reusable internal macro

(End definition for \prob@number. This function is documented on page ??.)

\prob@title We consolidate the problem title into a reusable internal macro as well. \prob@title takes three arguments the first is the fallback when no title is given at all, the second and third go around the title, if one is given.

```
\newcommand\prob@title[3]{%
      \tl_if_exist:NTF \l__problems_inclprob_title_tl {
6625
        #2 \l__problems_inclprob_title_t1 #3
6626
        \tl_if_exist:NTF \l__problems_prob_title_tl {
          #2 \1_problems_prob_title_t1 #3
6629
        }{
6630
6631
          #1
        }
6632
     }
6633
6634 }
```

(End definition for \prob@title. This function is documented on page ??.)
With these the problem header is a one-liner

\prob@heading We consolidate the problem header line into a separate internal macro that can be reused in various settings.

```
6635 \def\prob@heading{
6636 \{\prob@problem@kw}\ \prob@number\prob@title{~}{~(}{}\strut}
6637 \%\sref@label@id{\prob@problem@kw~\prob@number}{}
6638 }
```

(End definition for \prob@heading. This function is documented on page ??.)

With this in place, we can now define the problem environment. It comes in two shapes, depending on whether we are in boxed mode or not. In both cases we increment the problem number and output the points and minutes (depending) on whether the respective options are set.

#### sproblem

```

                                                                                                                   }
                                                                                  6725
                                                                                                           }
                                                                                  6726
                                                                                  6727 }
```

6676

(End definition for \record@problem. This function is documented on page ??.)

This macro acts on a problem's record in the \*.aux file. It does not have any functionality here, but can be redefined elsewhere (e.g. in the assignment package).

```
6728 \def\@problem#1#2#3{}
```

(End definition for \Oproblem. This function is documented on page ??.)

solution

The solution environment is similar to the problem environment, only that it is independent of the boxed mode. It also has it's own keys that we need to define first.

```
6729 \keys_define:nn { problem / solution }{
     id
                    .str_set_x:N = \l__problems_solution_id_str ,
                                   = \l__problems_solution_for_tl ,
     for
                    .tl_set:N
6731
                                   = \l__problems_solution_height_dim ,
     height
                    .dim set:N
6732
                    .clist_set:N = \l__problems_solution_creators_clist ,
     creators
6733
                    .clist_set:N = \l__problems_solution_contributors_clist ,
     contributors
6734
                    .tl set:N
                                   = \l__problems_solution_srccite_tl
6735
6736
6737 \cs_new_protected:Nn \__problems_solution_args:n {
     \str clear: N \l problems solution id str
6738
     \tl_clear:N \l__problems_solution_for_tl
6739
     \tl_clear:N \l__problems_solution_srccite_tl
     \verb|\clist_clear:N \ll_problems_solution_creators_clist|
     \clist_clear:N \l__problems_solution_contributors_clist
     \dim_zero:N \l__problems_solution_height_dim
     \keys_set:nn { problem / solution }{ #1 }
6744
6745 }
```

the next step is to define a helper macro that does what is needed to start a solution.

```
\newcommand\@startsolution[1][]{
      \__problems_solution_args:n { #1 }
6747
      \@in@omtexttrue% we are in a statement.
6748
      \bool if:NF \c problems boxed bool { \hrule }
6749
      \smallskip\noindent
6750
      {\textbf\prob@solution@kw :\enspace}
6751
      \begin{small}
      \def\current@section@level{\prob@solution@kw}
      \ignorespacesandpars
6754
6755 }
```

\startsolutions

for the \startsolutions macro we use the \specialcomment macro from the comment package. Note that we use the \@startsolution macro in the start codes, that parses the optional argument.

```
\newcommand\startsolutions{
      \specialcomment{solution}{\@startsolution}{
6757
        \bool_if:NF \c__problems_boxed_bool {
6758
          \hrule\medskip
6759
6760
        \end{small}%
6761
6762
      \bool_if:NT \c__problems_boxed_bool {
        \surroundwithmdframed{solution}
6764
6765
6766 }
```

```
(\textit{End definition for } \verb|\startsolutions|. \textit{This function is documented on page \ref{eq:page-1}})
\stopsolutions
                   6767 \newcommand\stopsolutions{\excludecomment{solution}}
                  (End definition for \stopsolutions. This function is documented on page ??.)
                       so it only remains to start/stop solutions depending on what option was specified.

#### 40.4 Including Problems

\includeproblem

The \includeproblem command is essentially a glorified \input statement, it sets some internal macros first that overwrite the local points. Importantly, it resets the inclprob keys after the input.

```
6865
         \keys_define:nn{ problem / inclproblem }{
6866
                                  .str_set_x:N = \l__problems_inclprob_id_str,
6867
                                                                      = \l__problems_inclprob_pts_tl,
                                  .tl_set:N
6868
                                  .tl_set:N
                                                                      = \l__problems_inclprob_min_tl,
             min
6869
             title
                                  .tl_set:N
                                                                      = \l__problems_inclprob_title_tl,
                                                                      = \l__problems_inclprob_refnum_int,
             refnum
                                 .int_set:N
                                                                     = \l__problems_inclprob_type_tl,

# Chapter 41

# Implementation: The hwexam Class

The functionality is spread over the hwexam class and package. The class provides the document environment and pre-loads some convenience packages, whereas the package provides the concrete functionality.

### 41.1 Class Options

To initialize the hwexam class, we declare and process the necessary options by passing them to the respective packages and classes they come from.

We load omdoc.cls, and the desired packages. For the LATEXML bindings, we make sure the right packages are loaded.

```
6985 \LoadClass{document-structure}
6986 \RequirePackage{stex}
6987 \RequirePackage{hwexam}
6988 \RequirePackage{tikzinput}
6989 \RequirePackage{graphicx}
6990 \RequirePackage{a4wide}
6991 \RequirePackage{amssymb}
6992 \RequirePackage{amstext}
6993 \RequirePackage{amsmath}
```

Finally, we register another keyword for the document environment. We give a default assignment type to prevent errors

# Chapter 42

# Implementation: The hwexam Package

#### 42.1 Package Options

The first step is to declare (a few) package options that handle whether certain information is printed or not. Some come with their own conditionals that are set by the options, the rest is just passed on to the problems package.

```
7003 (*package)
7004 \ProvidesExplPackage{hwexam}{2022/02/26}{3.0.1}{homework assignments and exams}
7005 \RequirePackage{13keys2e}
7006
7007 \newif\iftest\testfalse
7008 \DeclareOption{test}{\testtrue}
7009 \newif\ifmultiple\multiplefalse
7010 \DeclareOption{multiple}{\multipletrue}
7011 \DeclareOption*{\PassOptionsToPackage{\CurrentOption}{problem}}
7012 \ProcessOptions
Then we make sure that the necessary packages are loaded (in the right versions).
7013 \RequirePackage{keyval}[1997/11/10]
7014 \RequirePackage{problem}
For multilinguality, we define internal macros for keywords that can be specialized in
```

\hwexam@\*@kw

For multilinguality, we define internal macros for keywords that can be specialized in \*.ldf files.

```
7015 \newcommand\hwexam@assignment@kw{Assignment}
7016 \newcommand\hwexam@given@kw{Given}
7017 \newcommand\hwexam@due@kw{Due}
7018 \newcommand\hwexam@testemptypage@kw{This~page~was~intentionally~left~
7019 blank~for~extra~space}
7020 \def\hwexam@minutes@kw{minutes}
7021 \newcommand\correction@probs@kw{prob.}
7022 \newcommand\correction@pts@kw{total}
7023 \newcommand\correction@reached@kw{reached}
7024 \newcommand\correction@sum@kw{Sum}
7025 \newcommand\correction@grade@kw{grade}
7026 \newcommand\correction@forgrading@kw{To~be~used~for~grading,~do~not~write~here}
```

```
(End definition for \hwexam@*@kw. This function is documented on page ??.)
    For the other languages, we set up triggers
7027 \AddToHook{begindocument}{
7028 \ltx@ifpackageloaded{babel}{
7029 \makeatletter
7030 \clist_set:Nx \l_tmpa_clist {\bbl@loaded}
7031 \clist_if_in:NnT \l_tmpa_clist {ngerman}{
      \input{hwexam-ngerman.ldf}
7032
7033
7034 \clist_if_in:NnT \l_tmpa_clist {finnish}{
7035
      \input{hwexam-finnish.ldf}
7037 \clist_if_in:NnT \l_tmpa_clist {french}{
      \input{hwexam-french.ldf}
7039
    \clist_if_in:NnT \l_tmpa_clist {russian}{
7040
      \input{hwexam-russian.ldf}
7041
7042 }
7043 \makeatother
7044 }{}
7045 }
```

## 42.2 Assignments

7047 \newcounter{assignment}

Then we set up a counter for problems and make the problem counter inherited from problem.sty depend on it. Furthermore, we specialize the \prob@label macro to take the assignment counter into account.

```
\numberproblemsin{assignment}
7049 \renewcommand\prob@label[1]{\assignment@number.#1}
    We will prepare the keyval support for the assignment environment.
7050 \keys_define:nn { hwexam / assignment } {
7051 id .str_set_x:N = \l_hwexam_assign_id_str,
7052 number .int_set:N = \l_hwexam_assign_number_int,
7053 title .tl_set:N = \l_hwexam_assign_title_tl,
7054 type .tl_set:N = \label{eq:noise} = \label{eq:noise} 1_hwexam_assign_type_tl,
7055 given .tl_set:N = \l_hwexam_assign_given_tl,
7056 due .tl_set:N = \l_hwexam_assign_due_tl,
7057 loadmodules .code:n = {
   \bool_set_true:N \l__hwexam_assign_loadmodules_bool
7059
7061 \cs_new_protected:Nn \__hwexam_assignment_args:n {
7062 \str_clear:N \l__hwexam_assign_id_str
7063 \int_set:Nn \l__hwexam_assign_number_int {-1}
7064 \tl_clear:N \l_hwexam_assign_title_tl
7065 \t1_clear:N \l_hwexam_assign_type_tl
7066 \t1_clear:N \l_hwexam_assign_given_tl
7067 \tl clear:N \l hwexam assign due tl
7068 \bool_set_false:N \l__hwexam_assign_loadmodules_bool
```

```
7009 \keys_set:nn { hwexam / assignment }{ #1 }
7070 }
```

The next three macros are intermediate functions that handle the case gracefully, where the respective token registers are undefined.

The \given@due macro prints information about the given and due status of the assignment. Its arguments specify the brackets.

```
7071 \newcommand\given@due[2]{
7072 \bool_lazy_all:nF {
7073 {\t_if_empty_p:V \l_hwexam_inclassign_given_tl}
7074 {\tl_if_empty_p:V \l_hwexam_assign_given_tl}
7075 {\tl_if_empty_p:V \l_hwexam_inclassign_due_tl}
7076 {\tl_if_empty_p:V \l_hwexam_assign_due_tl}
7077 }{ #1 }
7078
   \tl_if_empty:NTF \l__hwexam_inclassign_given_tl {
7079
7080 \tl_if_empty:NF \l_hwexam_assign_given_tl {
7081 \hwexam@given@kw\xspace\l_hwexam_assign_given_tl
7082 }
7083 }{
   \hwexam@given@kw\xspace\l_hwexam_inclassign_given_tl
7085 }
7086
7087 \bool_lazy_or:nnF {
7088 \bool_lazy_and_p:nn {
7089 \tl_if_empty_p:V \l__hwexam_inclassign_due_tl
7090 }{
7091 \tl_if_empty_p:V \l_hwexam_assign_due_tl
7092 }
7093 }{
7094 \bool_lazy_and_p:nn {
7095 \tl_if_empty_p:V \l__hwexam_inclassign_due_tl
7097 \tl_if_empty_p:V \l__hwexam_assign_due_tl
7098 }
7099 }{ ,~ }
7100
7101 \tl_if_empty:NTF \l_hwexam_inclassign_due_tl {
7102 \tl_if_empty:NF \l_hwexam_assign_due_tl {
7103 \hwexam@due@kw\xspace \l_hwexam_assign_due_tl
7105 }{
7107
7108
7109 \bool_lazy_all:nF {
7110 { \tl_if_empty_p:V \l_hwexam_inclassign_given_tl }
7111 { \tl_if_empty_p:V \l_hwexam_assign_given_tl }
7112 { \tl_if_empty_p:V \l_hwexam_inclassign_due_tl }
7113 { \tl_if_empty_p:V \l_hwexam_assign_due_tl }
7114 }{ #2 }
7115 }
```

\assignment@title This macro prints the title of an assignment, the local title is overwritten, if there is one

from the \inputassignment. \assignment@title takes three arguments the first is the fallback when no title is given at all, the second and third go around the title, if one is given.

```
7116 \newcommand\assignment@title[3] {
7117 \tl_if_empty:NTF \l_hwexam_inclassign_title_tl {
7118 \tl_if_empty:NTF \l_hwexam_assign_title_tl {
7119 #1
7120 } {
7121 #2\l_hwexam_assign_title_tl#3
7122 }
7123 } {
7124 #2\l_hwexam_inclassign_title_tl#3
7125 }
7126 }
```

(End definition for \assignment@title. This function is documented on page ??.)

\assignment@number

Like \assignment@title only for the number, and no around part.

```
7127 \newcommand\assignment@number{
7128 \int_compare:nNnTF \l_hwexam_inclassign_number_int = {-1} {
7129 \int_compare:nNnTF \l_hwexam_assign_number_int = {-1} {
7130 \arabic{assignment}
7131 } {
7132 \int_use:N \l_hwexam_assign_number_int
7133 }
7134 }{
7135 \int_use:N \l_hwexam_inclassign_number_int
7136 }
7137 }
```

(End definition for \assignment@number. This function is documented on page ??.)

With them, we can define the central assignment environment. This has two forms (separated by \ifmultiple) in one we make a title block for an assignment sheet, and in the other we make a section heading and add it to the table of contents. We first define an assignment counter

assignment

For the assignment environment we delegate the work to the Cassignment environment that depends on whether multiple option is given.

```
7138 \newenvironment{assignment}[1][]{
7139 \__hwexam_assignment_args:n { #1 }
7140 %\sref@target
7141 \int_compare:nNnTF \l__hwexam_assign_number_int = {-1} {
7142 \global\stepcounter{assignment}
7143 }{
7144 \global\setcounter{assignment}{\int_use:N\l__hwexam_assign_number_int}
7145 }
7146 \setcounter{problem}{0}
7147 \def\current@section@level{\document@hwexamtype}
7148 %\sref@label@id{\document@hwexamtype \thesection}
7149 \begin{@assignment}
7150 }{
7151 \end{@assignment}
7152 }
```

In the multi-assignment case we just use the omdoc environment for suitable sectioning.

```
7153 \def\ass@title{
7154 \protect\document@hwexamtype~\arabic{assignment}
7155 \assignment@title{}{\;(}{)\;} -- \given@due{}{}
7156 }
7157 \ifmultiple
7158 \newenvironment{@assignment}{
7159 \bool_if:NTF \l__hwexam_assign_loadmodules_bool {
7160 \begin{sfragment}[loadmodules]{\ass@title}
7162 \begin{sfragment}{\ass@title}
7163 }
7164 }{
7165 \end{sfragment}
7166 }
for the single-page case we make a title block from the same components.
7168 \newenvironment{@assignment}{
7169 \begin{center}\bf
7170 \Large\@title\strut\\
7171 \document@hwexamtype~\arabic{assignment}\assignment@title{\;}{:\;}{\\}
7172 \large\given@due{--\;}{\;--}
7173 \end{center}
7174 }{}
7175 \fi% multiple
```

## 42.3 Including Assignments

\in\*assignment

This macro is essentially a glorified \include statement, it just sets some internal macros first that overwrite the local points Importantly, it resets the inclassig keys after the input.

```
7176 \keys_define:nn { hwexam / inclassignment } {
7177 %id .str_set_x:N = \l_hwexam_assign_id_str,
number .int_set:N = \l_hwexam_inclassign_number_int,
7179 title .tl_set:N = \l_hwexam_inclassign_title_tl,
7180 type .tl_set:N = \l_hwexam_inclassign_type_tl,
7181 given .tl_set:N = \l_hwexam_inclassign_given_tl,
7182 due .tl_set:N = \l_hwexam_inclassign_due_tl,
7183 mhrepos .str set x:N = \label{eq:normalized} hwexam inclassign mhrepos str
7184 }
7185 \cs_new_protected:Nn \_hwexam_inclassignment_args:n {
