	4.6 Symbol Declarations	39

2 Manual

2.1 Archives and Imports

2.1.1 Namespaces

Ideally, STEX would use arbitrary URIs for modules, with no forced relationships between the *logical* namespace of a module and the *physical* location of the file declaring the module – like MMT does things.

Unfortunately, TEX only provides very restricted access to the file system, so we are forced to generate namespaces systematically in such a way that they reflect the physical location of the associated files, so that STEX can resolve them accordingly. Largely, users need not concern themselves with namespaces at all, but for completenesses sake, we describe how they are constructed:

- If \begin{module}{Foo} occurs in a file /path/to/file/Foo[.\lang\].tex which does not belong to an archive, the namespace is file://path/to/file.
- If the same statement occurs in a file /path/to/file/bar[. $\langle lang \rangle$].tex, the namespace is file://path/to/file/bar.

In other words: outside of archives, the namespace corresponds to the file URI with the filename dropped iff it is equal to the module name, and ignoring the (optional) language suffix¹.

If the current file is in an archive, the procedure is the same except that the initial segment of the file path up to the archive's source-folder is replaced by the archive's namespace URI.

2.1.2 Paths in Import-Statements

Conversely, here is how namespaces/URIs and file paths are computed in import statements, examplary \importmodule:

- \importmodule{Foo} outside of an archive refers to module Foo in the current namespace. Consequently, Foo must have been declared earlier in the same document or, if not, in a file Foo[. $\langle lang \rangle$].tex in the same directory.
- The same statement within an archive refers to either the module Foo declared earlier in the same document, or otherwise to the module Foo in the archive's top-level namespace. In the latter case, is has to be declared in a file Foo[. $\langle lang \rangle$].tex directly in the archive's source-folder.
- Similarly, in \importmodule{some/path?Foo} the path some/path refers to either the sub-directory and relative namespace path of the current directory and namespace outside of an archive, or relative to the current archive's top-level namespace and source-folder, respectively.
 - The module Foo must either be declared in the file $\langle top\text{-}directory \rangle$ /some/path/Foo[. $\langle lang \rangle$].tex, or in $\langle top\text{-}directory \rangle$ /some/path[. $\langle lang \rangle$].tex (which are checked in that order).
- Similarly, \importmodule[Some/Archive]{some/path?Foo} is resolved like the previous cases, but relative to the archive Some/Archive in the mathhub-directory.

¹which is internally attached to the module name instead, but a user need not worry about that.

• Finally, \importmodule{full://uri?Foo} naturally refers to the module Foo in the namespace full://uri. Since the file this module is declared in can not be determined directly from the URI, the module must be in memory already, e.g. by being referenced earlier in the same document.

Since this is less compatible with a modular development, using full URIs directly is discouraged.

3 Documentation

3.1 Utils

\stex_debug:n \stex_debug:n \stex_debug:n \{\message\}\}
\tex_kpsewhich:n \stex_kpsewhich_return_str. This does not require shell escaping.
\stex_addtosms:n Adds the provided code to the .sms-file of the document.

3.1.1 SCALATEXML and HTML Annotations

We have four macros for annotating generated HTML (via LATEXML or SCALATEX) with attributes:

 $\stex_annotate:nnn $$ \stex_annotate:nnn {\property} $ {\content} $ \stex_annotate_invisible:nnn $$ \stex_annotate_invisible:n}$

Annotates the HTML generated by $\langle content \rangle$ with

property="stex: $\langle property \rangle$ ", resource=" $\langle resource \rangle$ ".

\stex_annotate_invisible:n adds the attributes

stex:visible="false", style="display:none".

\stex_annotate_invisible:nnn combines the functionality of both.

stex_annotate_env

3.1.2 Languages

\c_stex_languages_prop
\c_stex_language_abbrevs_prop

Map language abbreviations to their full babel names and vice versa. e.g. \c_stex_languages_prop{en} yields english, and \c_stex_language_abbrevs_prop{english} yields en.

3.2 Files, Paths, URIs

 $\label{lem:lem:lem:nom_string:Nn} $$ \operatorname{path_from_string:Nn} \ \operatorname{path-variable} \ {\langle string \rangle} \ \operatorname{path_from_string:(NV|cn|cV)} $$$

turns the $\langle string \rangle$ into a path by splitting it at /-characters and stores the result in $\langle path-variable \rangle$. Also applies $\text{stex_path_canonicalize:N}$.

\stex_path_to_string:NN \stex_path_to_string:N

The inverse; turns a path into a string and stores it in the second argument variable, or leaves it in the input stream.

\stex_path_canonicalize:N

Canonicalizes the path provided; in particular, resolves . and .. path segments.

 $\stex_path_if_absolute_p:N \star \\stex_path_if_absolute:NTF \star$

Checks whether the path provided is absolute, i.e. starts with an empty segment

\c_stex_pwd_seq
\c_stex_pwd_str
\c_stex_mainfile_seq

Store the current working directory as path-sequence and string, respectively, and the (heuristically guessed) full path to the main file, based on the PWD and \jobname.

\g_stex_currentfile_seq

The file being currently processed (respecting \input etc.)

3.3 MathHub Archives

\mathhub \c_stex_mathhub_seq \c_stex_mathhub_str

We determine the path to the local MathHub folder via one of three means, in order of precedence:

- 1. The mathhub package option, or
- 2. the \mathhub-macro, if it has been defined before the \usepackage{stex}-statement, or
- 3. the MATHHUB system variable.

In all three cases, \c_stex_mathhub_seq and \c_stex_mathhub_str are set accordingly.

\l_stex_current_repository_prop

Always points to the *current* MathHub repository (if we currently are in one). Has the fields id, ns (namespace), narr (narrative namespace; currently not in use) and deps (dependencies; currently not in use).

\stex_set_current_repository:n

Sets the current repository to the one with the provided ID. calls __stex_mathhub_-do_manifest:n, so works whether this repository's MANIFEST.MF-file has already been read or not.

\stex_require_repository:n

Calls __stex_mathhub_do_manifest:n iff the corresponding archive property list does not already exist, and adds a corresponding definition to the .sms-file.

3.4 The Module System

\l_stex_current_module_prop

All information of a module is stored as a property list. \l_stex_current_module_prop always points to the current module (if existent).

Most importantly, the **content**-field stores all the code to execute on activation; i.e. when this module is being included.

Additionally, it stores:

- The *name* in field name,
- the namespace in field ns,
- this module's language in field lang,
- if a language module that translates some other modules, the *original* module in field sig (for signature),
- the metatheory in field meta,
- the URIs of all imported modules in field imports,
- the names of all declarations in field constants,
- the file this module was declared in in field file,

 $\label{lem:conditional} $$ \operatorname{if_in_module_p:} \ \star $$ Conditional for whether we are currently in a module \\ \operatorname{stex_if_in_module:} $TF \ \star $$ $$$

\stex_if_module_exists_p:n *\stex_if_module_exists:nTF *

Conditional for whether a module with the provided URI is already known.

\stex_add_to_current_module:n

Adds the provided tokens to the content field of the current module.

\stex_add_constant_to_current_module:n

Adds the declaration with the provided name to the constants field of the current module.

\stex_add_import_to_current_module:n

Adds the module with the provided full URI to the imports field of the current module.

\stex_modules_compute_namespace:nN

Computes the namespace for file $\langle path \rangle$ in repository with namespace $\langle namespace \rangle$ as follows:

If the file is .../source/sub/file.tex and the namespace http://some.namespace/foo, then the namespace of is http://some.namespace/foo/sub/file.

\stex_modules_current_namespace:

Computes the current namespace

3.4.1 The module-environment

module

\begin{module} [$\langle options \rangle$] { $\langle name \rangle$ } Opens a new module with name $\langle name \rangle$. TODO document options.

\stex_modules_heading:

Takes care of the module header, if the **showmods** package option is true. This macro can be overridden for customization.

@module

 $\begin{Conduction} \begin{Conduction} \aligned \begin{Conduction} \aligned \aligne$

3.4.2 SMS Mode

"SMS Mode" is used when loading modules from external tex files. It deactivates any output and ignores all TEX commands not explicitly allowed via the following lists:

$\g_stex_smsmode_allowedmacros_tl$

Macros that are executed as is; i.e. with the category code scheme used in SMS mode.

$\g_stex_smsmode_allowedmacros_escape_tl$

Macros that are executed with the category codes restored.

Importantly, these macros need to call \stex_smsmode_set_codes: after reading all arguments. Note, that \stex_smsmode_set_codes: takes care of checking whether we are in SMS mode in the first place, so calling this function eagerly is unproblematic.

\g_stex_smsmode_allowedenvs_seq

The names of environments that should be allowed in SMS mode. The corresponding \begin-statements are treated like the macros in \g_stex_smsmode_allowedmacros_-escape_t1, so \stex_smsmode_set_codes: should be called at the end of the \begin-code. Since \end-statements take no arguments anyway, those are called with the SMS mode category code scheme active.

8

\stex_if_smsmode_p: *
\stex_if_smsmode:TF *

Tests whether SMS mode is currently active.

\stex_smsmode_set_codes:

Sets the current category code scheme to that of the SMS mode, if SMS mode is currently active and if necessary.

This method should be called at the end of every macro or **\begin** environment code that are allowed in SMS mode.

\stex_in_smsmode:nn

 $\sum_{n=0}^{\infty} {\langle name \rangle} {\langle code \rangle}$

Executes $\langle code \rangle$ in SMS mode. $\langle name \rangle$ can be arbitrary, but should be distinct, since it allows for nesting $\text{stex_in_smsmode:nn}$ without spuriously terminating SMS mode.

3.4.3 Imports and Inheritance

\importmodule

 $\verb|\importmodule[|\langle archive-ID\rangle]| = \{|\langle module-path\rangle|\}$

Imports a module by reading it from a file and "activating" it. STEX determines the module and its containing file by passing its arguments on to \stex_import_module_-path:nn.

\usemodule

 $\verb|\importmodule[\langle archive-ID\rangle] {\langle module-path\rangle}|$

Like \importmodule, but does not export its contents; i.e. including the current module will not activate the used module

\stex_import_module_uri:nn

 $\stex_import_module_uri:nn \{\langle archive-ID \rangle\} \{\langle module-path \rangle\}$

Determines the URI of a module by splitting $\langle module\text{-}path \rangle$ into $\langle path \rangle$? $\langle name \rangle$. If $\langle module\text{-}path \rangle$ does not contain a ?-character, we consider it to be the $\langle name \rangle$, and $\langle path \rangle$ to be empty.

If $\langle archive\text{-}ID \rangle$ is empty, it is automatically set to the ID of the current archive (if one exists).

1. If $\langle archive\text{-}ID \rangle$ is empty:

- (a) If $\langle path \rangle$ is empty, then $\langle name \rangle$ must have been declared earlier in the same file and retrievable from $\g_stex_modules_in_file_seq$, or a file with name $\langle name \rangle . \langle lang \rangle$. tex must exist in the same folder, containing a module $\langle name \rangle$. That module should have the same namespace as the current one.
- (b) If $\langle path \rangle$ is not empty, it must point to the relative path of the containing file as well as the namespace.

2. Otherwise:

(a) If $\langle path \rangle$ is empty, then $\langle name \rangle$ must have been declared earlier in the same file and retrievable from $\g_stex_modules_in_file_seq$, or a file with name $\langle name \rangle . \langle lang \rangle . tex$ must exist in the top source folder of the archive, containing a module $\langle name \rangle$.

That module should lie directly in the namespace of the archive.

(b) If $\langle path \rangle$ is not empty, it must point to the path of the containing file as well as the namespace, relative to the namespace of the archive.

If a module by that namespace exists, it is returned. Otherwise, we call \stex_require_module:nn on the source directory of the archive to find the file.

\stex_import_require_module:nnnn

TODO

\g_stex_module_files_prop \g_stex_modules_in_file_seq

A property list mapping file paths to the lists of all modules declared therein. \g_stex_-modules_in_file_seq always points to the current file(-stream - \inputs are considered the same file).

4 Implementation

4.1 The STEX document class

- 1 (*cls)
- 2 \RequirePackage{expl3,13keys2e}
- 3 \ProvidesExplClass{stex}{2021/08/01}{1.9}{bla}
- 4 \LoadClass[border=1px,varwidth]{standalone}
- 5 \setlength\textwidth{15cm}

```
\DeclareOption*{\PassOptionsToPackage{\CurrentOption}{stex}}
                                               \ProcessOptions
                                          11 \RequirePackage{stex}
                                                     Preliminaries
                                      4.2
                                          13 (*package)
                                          14 \RequirePackage{expl3,13keys2e}
                                          _{15} \ensuremath{\mbox{\sc NF}}\ensuremath{\mbox{\sc NF}}\ensuremat
                                                Package options:
                                          16 \keys_define:nn { stex } {
                                                                                                             = \c_stex_debug_bool ,
                                                    debug .bool_set:N
                                          17
                                                   showmods .bool_set:N = \c_stex_showmods_bool,
                                          18
                                                                            .clist_set:N = \c_stex_languages_clist ,
                                                 lang
                                          20 mathhub .tl_set_x:N = \mathhub ,
                                                                            .bool_set:N = \c_stex_persist_mode_bool
                                                  sms
                                          21
                                          22 }
                                          23 \ProcessKeysOptions { stex }
                    \sTeX The STeX logo:
                                          24 \protected\def\stex{%
                                                    \@ifundefined{texorpdfstring}%
                                                    {\let\texorpdfstring\@firstoftwo}%
                                                    \texorpdfstring{\raisebox{-.5ex}S\kern-.5ex}{sTeX}{sTeX}\xspace\%
                                          28
                                          29 }
                                          30 \def\sTeX{\stex}
                                      (End definition for \sTeX. This function is documented on page 4.)

```

\stex_annotate:enw \stex_annotate_invisible:nn \stex_annotate_invisible:nnn We define four macros for introducing attributes in the HTML output. The definitions depend on the "backend" used (LATEXML, SCALATEX, pdflatex).

The pdflatex-macros largely do nothing; the SCALATEX-implementations are pretty clear in what they do, the LATEXML-implementations resort to perl bindings.

4.2.3 Languages

```
173 (@@=stex_language)
```

\c_stex_languages_prop
\c_stex_language_abbrevs_prop

We store language abbreviations in two (mutually inverse) property lists:

```
174 \prop_const_from_keyval:Nn \c_stex_languages_prop {
     en = english ,
175
     de = ngerman ,
176
     ar = arabic ,
177
     bg = bulgarian ,
178
     ru = russian ,
179
     fi = finnish ,
181
     ro = romanian ,
     tr = turkish ,
182
     fr = french
183
184 }
185
   \prop_const_from_keyval:Nn \c_stex_language_abbrevs_prop {
186
187
     english
               = en ,
     ngerman
                = de ,
188
     arabic
                = ar ,
189
     bulgarian = bg ,
     russian = ru ,
191
192
     finnish
                = fi,
     romanian = ro ,
193
               = tr ,
     turkish
194
     french
                = fr
195
196 }
197 % todo: chinese simplified (zhs)
198 %
           chinese traditional (zht)
```

(End definition for \c_stex_languages_prop and \c_stex_language_abbrevs_prop. These variables are documented on page 5.)

we use the lang-package option to load the corresponding babel languages:

```
\clist_if_empty:NF \c_stex_languages_clist {
     \clist_clear:N \l_tmpa_clist
201
     \clist_map_inline:Nn \c_stex_languages_clist {
       \prop_get:NnNTF \c_stex_languages_prop { #1 } \l_tmpa_str {
202
         \clist_put_right:No \l_tmpa_clist \l_tmpa_str
203
       } {
204
         % TODO throw an error
205
       }
206
207
     \stex_debug:n {Languages:~\clist_use:Nn \l_tmpa_clist {,~} }
208
209
     \RequirePackage[\clist_use:Nn \l_tmpa_clist ,]{babel}
210 }
```

4.3 Files, Paths and URIs

```
211 (@@=stex_path)
```

4.3.1 Generic Path Handling

We treat paths as LATEX3-sequences (of the individual path segments, i.e. separated by a /-character) unix-style; i.e. a path is absolute if the sequence starts with an empty entry.

```
\stex_path_from_string:Nn

4.3.3 File Hooks and Tracking

```
296 (@@=stex_files)
```

We introduce hooks for file inputs that keep track of the absolute paths of files used. This will be useful to keep track of modules, their archives, namespaces etc.

(End definition for \c_stex_pwd_seq and \c_stex_pwd_str. These variables are documented on page

Note that the absolute paths are only accurate in $\mbox{input-statements}$ for paths relative to the PWD, so they shouldn't be relied upon in any other setting than for $\mbox{ST}_{E}X$ -purposes.

\g_stex_files_stack keeps track of file changes

5.)

```
